BOOSTER SETS GS SERIES

GENERAL INTRODUCTION - PRODUCT DESCRIPTION

The GS series pressure booster units mainly comprise pumping stations assembled with two or three SV series vertical multistage pumps, or with FH or SH series en bloc horizontal pumps. A smaller pump can also be added to the main ones. Generally known as a jockey pump, it provides for minor usages in order to maintain system pressure without starting the service pump.

The GS series pressure booster units are constant speed sets and are used to distribute water in heating or filling systems.

The pumps are mounted on a single base together with the other hydraulic components, such as on-off valves, check valves and the delivery and return manifolds.

The electrical panel, supplied with a mounting bracket, is attached to the pressure booster unit base.

The pumps start and stop according to the signals sent by the pressure transducer to the electrical control panel.

The latter is fitted with an integrated electronic board. The pumps start and stop automatically depending on the water demand of the system.

These pressure booster systems are combined with suitable expansion tanks in order to guarantee stable operation and reduce the starting frequency of the pumps.

For the correct choice in capacity of the expansion vessel, see the relative chapter on page 116 of the catalogue.

DESCRIPTION OF OPERATION

The pumps start and stop according to the set pressures detected by the pressure transducer, thus ensuring the required amount of water is delivered. The pressure values can be directly set on the electronic board.

For units with jockey pump, the latter will start first and stop last, depending on the set pressure values.

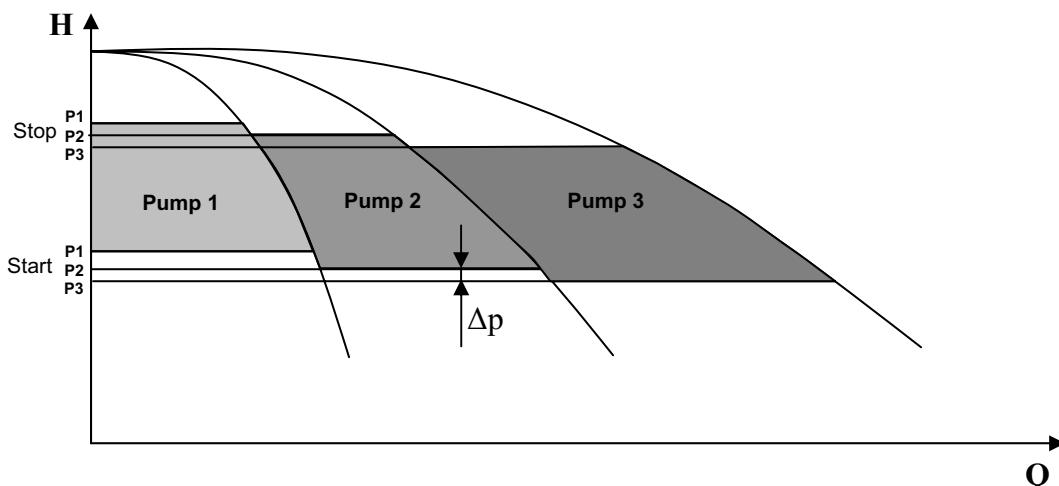

When a tap is opened, water is drawn off from the tank, the pressure starts to fall until it reaches the starting value of the first pump. The delivery of water increases, the pressure falls even further and the other pumps start in sequence according to the demand for water.

When consumption falls, the pressure in the system increases and the pumps stop when the set threshold pressure values are reached.

If consumption falls to zero user demand, the last pump also stops.

If the "timer" function is used, the last pump to work will remain operating for a set time after it is switched off, in order to reach maximum pressure. Make sure the maximum pressure is compatible with the system in which the pump is installed.

Example: GS series pressure booster units, operation.

Δp pressure differential between pumps, can be reduced to 0,5 bar.

BOOSTER SETS GS SERIES CHOICE AND SELECTION

The demand of a water distribution system is generally determined by the designer according to the type of user structure being served.

Users can be schools, hospitals, homes, offices, industries, hotels, shopping centres and for each the water demand changes due to the different requirements of the people living and working in these structures. To find the correct flow rate for the system in question, it is possible to consult pre-calculated tables that give an idea of the flow rate for the typology of user to serve (see pages 108-109 in this catalogue).

Integral system calculation, instead, prevents excessive oversizing and therefore reduces running and installation costs.

The theoretical water demand is calculated by summing the demand of each user. As, however, it is improbable that all users will want to use water at the same time, real demand is lower than theoretical demand.

After defining the flow rate of the system, the head must be calculated. This must consider the following:

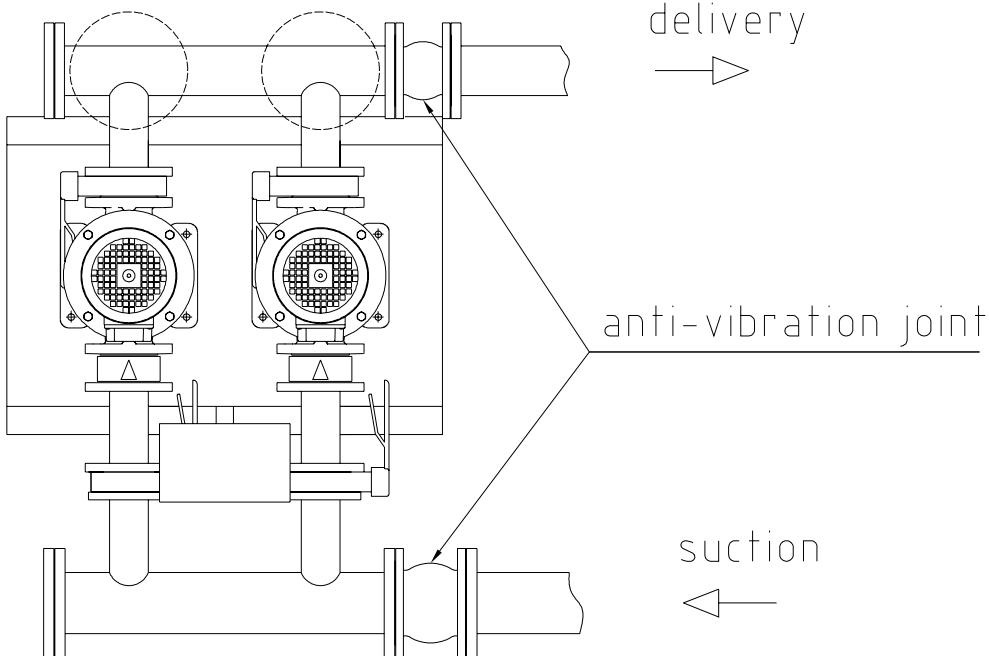

- geodesic head: difference in level between the pumping station and the highest user
- residual head: pressure demand from the most unfavourable user to serve
- pressure drops: value in metres of pressure drops due to friction in the delivery pipes
- inlet height: difference in level between the pump inlet and the surface of the water in the tank (positive or negative depending on the installation type)
- inlet pressure drops: value in metres of pressure drops due to friction in the inlet piping and in any curves and valves.

After analysing the above, the head required for the system is calculated.

Now that the flow rate and head values are known, the most suitable pressure booster unit for the system can be chosen. The designer must decide whether to choose a pressure booster unit with two or three pumps, the third being a reserve pump satisfying demand during pump maintenance periods.

INSTALLATION

The GS series of pressure booster units must be installed in areas protected from frost and adequately ventilated in order to allow the motors to cool. The delivery and intake pipes should be connected using anti-vibration joints in order to limit vibrations and resonance in the system.

antiv-gs-en_b_dd

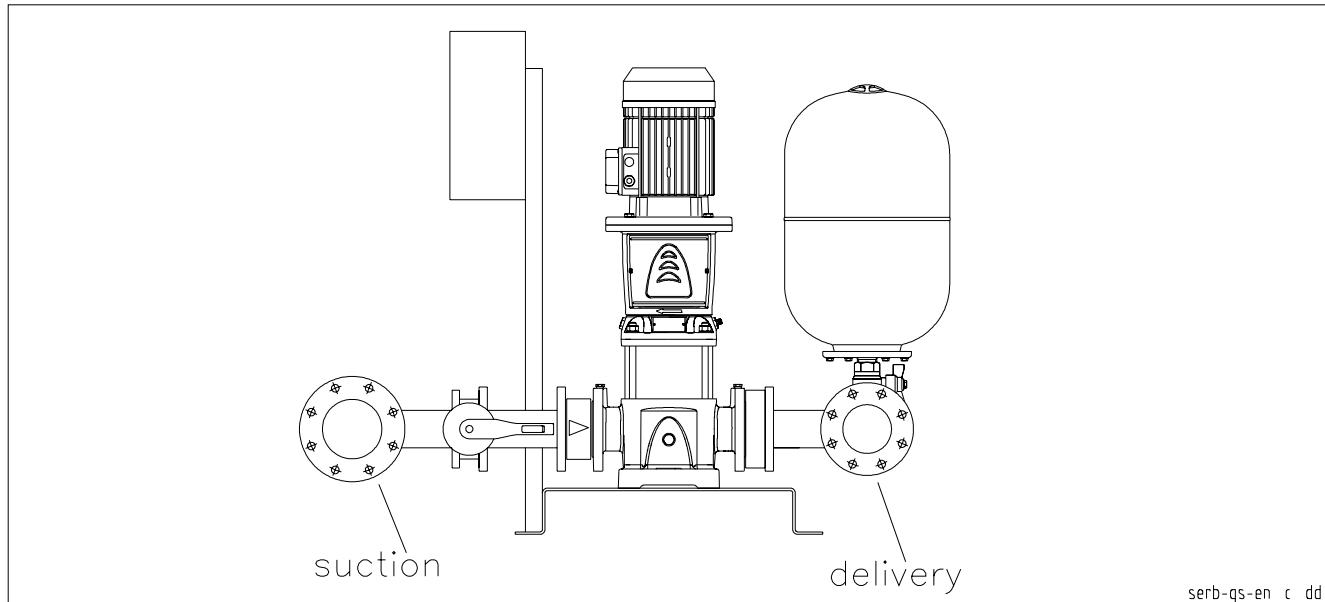

BOOSTER SETS GS SERIES INSTALLATION

The GS series of pressure booster units are generally connected to pressurised tanks with a suitable capacity for the system. These tanks are normally expansion vessels for capacities up to 500 L. Tanks with higher capacities can also be supplied if necessary. In these cases, they are air-cushion tanks and a compressor is required to maintain the pressure inside the tank.

In both cases, the tanks must be connected on the pressure booster unit delivery line. The system, commonly known as an "autoclave", provides the system with a reserve of pressurised water and prevents frequent pump start-ups.

For these systems, sufficient space must always be allowed in the area where the pressure booster set is installed.

Always check maximum pump pressure in order to choose the right tanks for the pressure in question.

SUCTION CONDITIONS

Installation of the pressure booster set must be assessed especially as regards intake conditions. Intake conditions can negatively or positively affect the performance of the pressure booster unit and consequently system performance. A positive suction head is ideal for a pressure booster unit as it keeps the pumps constantly primed and the positive difference in level adds pressure to the system.

A negative suction head is different. In this case, the risks for the pumps are priming which is connected with the intake piping, the NPSH of the pump and the difference in level between the pump and the water in the tank.

In this type of installation, after checking the intake capacity of the pump, the overall pressure drop in the intake line must be calculated as this will reduce pump performance and consequently that of the pressure booster unit.

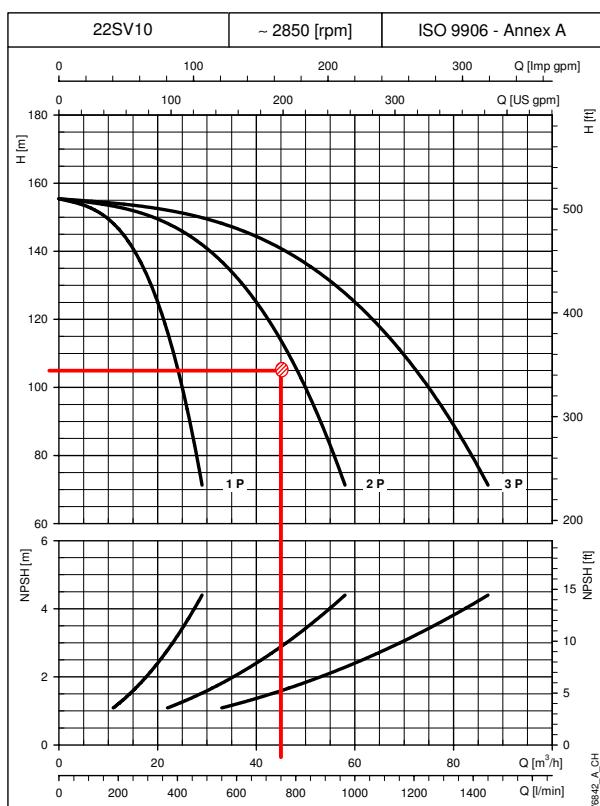

In order to select the right pressure booster unit, the performance levels of the pumps installed on them are indicated in this catalogue. To simplify the calculation of net pressure, pressure drop curves, both for the delivery and intake lines of the pumps have been included (see the relative chapter).

BOOSTER SETS GS SERIES CALCULATING NET PRESSURE

When selecting the GS series of pressure booster units, reference must be made to pump performance. Performance is calculated from the characteristic curves of the pumps and does not consider any pressure drops generated by pipes and valves as in the pressure booster units.

To help choose the right pressure booster unit and calculate the correct pressure at the delivery manifold, the following example is shown:

Given the duty point $Q = 42 \text{ m}^3/\text{h}$ $H = 105 \text{ mca}$ and with two pumps working, the pump with the most suitable characteristic curve is chosen, that is, the one with a curve that guarantees the required flow and head values.

From the example, we have chosen the 22SV10 series pump which guarantees system performance. The pump curve is slightly oversized, but this provides a safety margin to counter the pressure drops in the pressure booster unit pipes. To know the effective pressure at the delivery manifold outlet, the pressure drops in the suction and delivery lines of each pump are calculated.

To simplify calculations, the pressure drop curves for each pump, on page 98 of this catalogue, are used.

Assuming a pressure booster unit with check valves on the suction line (curve B of Hc pressure drops) has been selected, one proceeds as follows:

The Hc pressure drops on the pump suction line are evaluated on the "B" curve. At a flow rate of $21 \text{ m}^3/\text{h}$ the value of $H_c = 2,8 \text{ m}$.

Similarly, the Hc pressure drops on the delivery line of the pump, as evaluated on the "B" curve, are analysed. At a flow rate of $21 \text{ m}^3/\text{h}$, the value of H_c is $0,035 \text{ m}$.

The total pressure drop on the delivery and suction lines is therefore $2,84 \text{ m}$.

As regards the pressure drop in the suction and delivery manifolds, 5% with respect to the pressure drops in the pump suction and delivery can be considered.

In this case, therefore, the value is $0,142 \text{ m}$.

The total pressure drop is approximately: 3 m .

Analysing the performance of the unit at a flow rate of $42 \text{ m}^3/\text{h}$, the head H is 115 m .

The net pressure at the delivery manifold is $115 - 3 = 112 \text{ m}$.

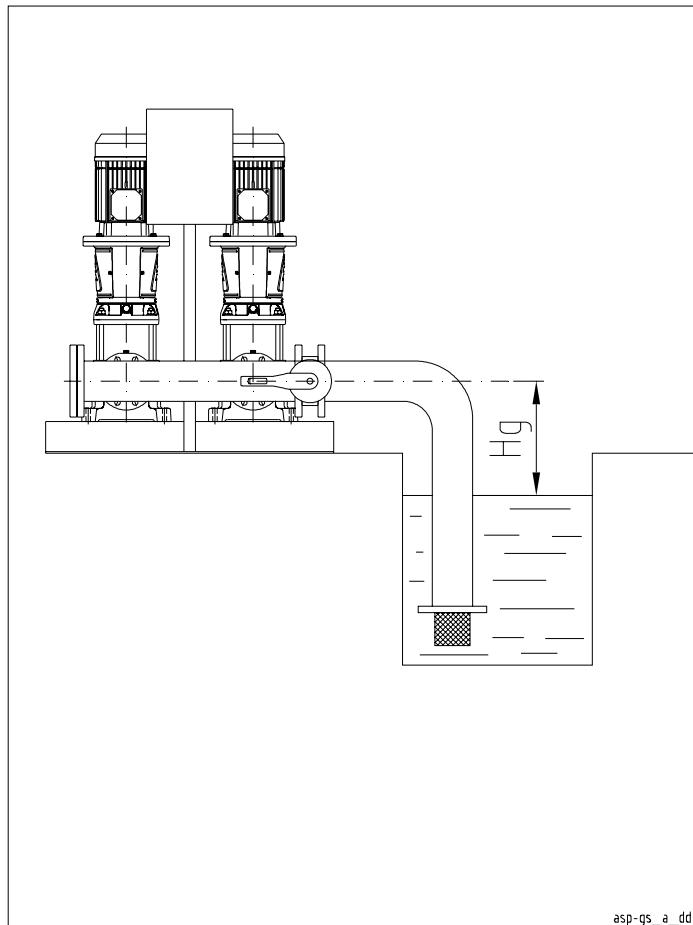

Comparing this value with the rated value, $112 \text{ m} > 105 \text{ m}$.

The unit can therefore satisfy the demand of the system.

BOOSTER SETS GS SERIES SUCTION CONDITIONS

The above example does not consider the suction conditions of the pressure booster unit which, similarly, affect final performance. It is therefore always best to check the suction line for leaks, especially as regards positive head installations.

An example of positive head installation relative to the above case is shown below:

In the positive head installation, the designer must calculate the minimum installation height H_g of the pump in safety conditions in order to avoid cavitation and, therefore, de-priming of the pump.

The relationship that must be checked and which connects this measurement is the following:

$NPSH \text{ available} \geq NPSH \text{ requested}$ where equality is the limit condition.

$$NPSH \text{ available} = P_{atm} + H_g - \sum \text{pressure drops}.$$

Where:

P_{atm} is the atmospheric pressure, equal to 10,33 m
 H_g is the geodetic difference in level

The pressure drops are connected with to the suction piping and relative valves (foot and cut-off valves)

$NPSH$ requested is a pump parameter taken from the performance curve of the pump which in our case, at a flow rate of 21 m³/h corresponds to 2,5 m. Before calculating the $NPSH$ available, the suction pressure drops are calculated using the tables on pages 117-118 in this catalogue, considering a material such as steel.

The chosen diameter of the suction piping is DN80.

90° curve DN80 = 2,11 m

Damper DN80 = 0,28 m

Drain valve DN80 = 0,3 m (calculated from supplier data)

Piping DN80 = 0,61 m (assuming a length of 2,5 m)

Piping DN80, intake manifold = 0,04 m (length of manifold 0,61 m)

Pressure drops on pump suction side (curve B) = 2,8 m

$$\sum \text{pressure drops} = 6,1 \text{ m}$$

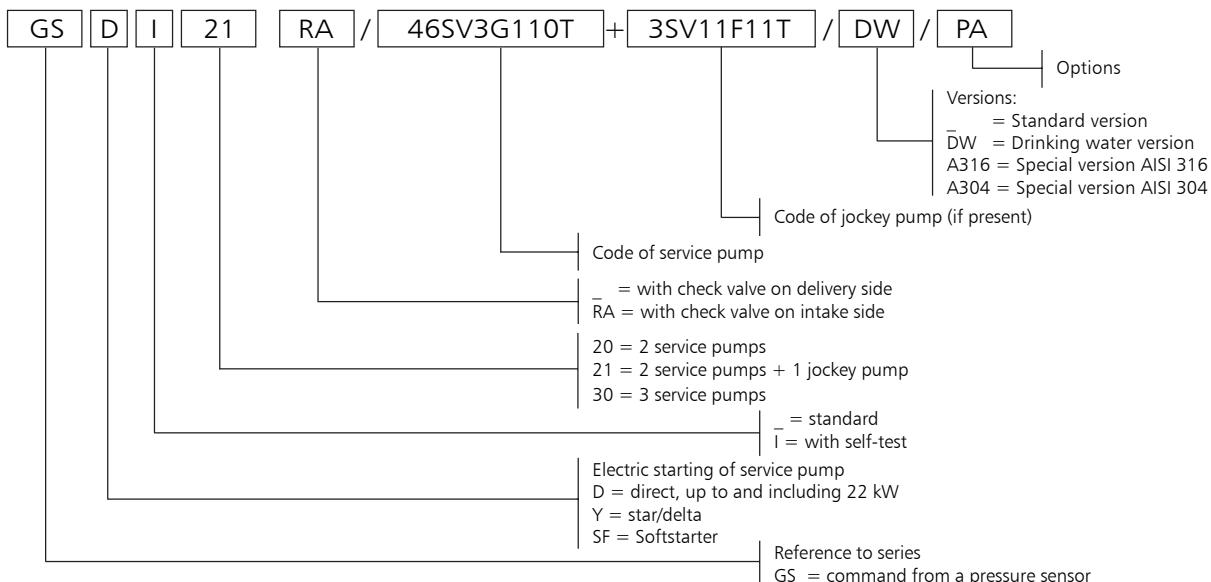

Remembering that: $NPSH \text{ available} = 10,33 + H_g - 6,1$

Replacing: $10,33 + H_g - 6,1 \geq 2,5$

$$H_g = 2,5 + 6,1 - 10,33 = -1,73 \text{ m}$$
 representing the limit, for which reason: $NPSH \text{ available} = NPSH \text{ requested}$

Generally speaking, therefore, in order to assure correct operating conditions as regards the risk of cavitation, the pump must be positioned above the level of the tank so that the suction height is lower than the limit value of 1,73 m.

SET IDENTIFICATION CODE

OPTIONS (ON DEMAND)

- 230 Power supply of control panel 3 x 230V. For different voltage supply, see control panel section.
- 3A Booster set with electric pump certified 1A (Factory test reports issued by the end of assembly line; it includes QH curve).
- 3B Booster set with electric pump certified 1B (Test report issued by Audit Test Lab; it includes QH curve, efficiency and power).
- 60 Booster set with 60Hz supply voltage.
- BAP High pressure switch installed on the delivery manifold.
- C9 Delivery manifold at 90° with bend. The tanks can not be installed directly on the manifold.
- CM Suction or delivery manifold larger than standard size.
- CP Dry contact version: power line, Automatic/Manual mode, Run/Stop for each pump, thermal block.
- IP65 IP65 version control panel.
- KV Kit voltmeter.
- MA Pressure gauge installed on suction manifold.
- NL Dutch market version.
- PA Minimum pressure gauge installed on the suction manifold for dry-running protection.
- PP Pressure-switch control.
- PQ Booster set with higt suction pressure (pressure gauge/pressure switches/pressure transmitter increased of one range).
- RA Non return valves mounted on suction side (I.e GMD20RA/SV...).
- RE Heaters inside the control panel, with thermostat.
- RV Electric panel with phase sequence, phase loss, over- and undervoltage and phase unbalance.
- SA No intake: no suction valves and suction manifold.
- SC Group with no control devices, such as pressure switches and transmitters; the pressure gauge is present.
- SCA No suction manifold (suction valves present).
- SCM Without delivery manifold (no pressure transmitters and pressure gauge, with delivery valves).
- SM Without delivery: without valves on delivery and without delivery manifold.
- TS Booster set with pumps equipped with special mechanical seals.
- UK UK market version.
- VA Electric control panel fitted with analogue voltmeter and ammeter.
- WM Wall-mounted electrical panel with fixing tabs. Cables L= 5m

AVAILABLE VERSIONS

- A304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Bolts and screws galvanized. Flanges not in contact with the liquid in galvanized steel.
- B304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Bolts and screws in Aisi 304 or superior. Flanges not in contact with the liquid in Aisi 304 or superior.
- C304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Baseplate, frame, supports, bolts and screws in Aisi 304 or superior. Flanges not in contact with the liquid in Aisi 304 or superior. Valves and their components completely in Aisi 304 or superior (body, disc, plate).
- A316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinking water. Pumps in Aisi 316 material. Bolts and screws galvanized. Flanges not in contact with the liquid in galvanized steel.
- B316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinkingwater. Pumps in Aisi 316 material. Bolts and screws in Aisi 316. Flanges not in contact with the liquid in Aisi 316.
- C316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinking water. Pumps in Aisi 316 material. Baseplate, frame, supports, bolts and screws in Aisi 316. Flanges not in contact with the liquid in Aisi 316. Valves and their components completely in Aisi 316 (body, disc, plate).
- DW Main component in contact with fluid suitable for drinking water or in stainless steel AISI 304 or superior quality.

CONTROL PANEL FOR GS20, GS21, GS30

Electric panel for powering, controlling and protecting a maximum of three three-phase pumps, with sheet steel casing (fig. 1) and protected to IP55.

Main characteristics:

- General doorlock switch, fuse holders and fuses, starting contactors and circuit breakers.
- Standard input voltage: 3x400Vca +/-10%, 50/60Hz.
Non-standard voltages available on request, 1x230Vac +/-10%, 3x230ca +/-10%, 50/60Hz.
- Transformer for auxiliary low voltage circuit; auxiliary voltage 24Vac.
- Lowara SM30 digital microprocessor-controlled control unit with LCD display and programming keyboard (see fig. 2), featuring the following functions:
 - Indicator lamps: power on (ref.1), general fault (ref.2), no water alarm (ref.3), pump running (ref.4);
 - Programming keyboard (ref.5);
 - Manual pump stop/start (one button for each pump) (ref.5);
 - Automatic cascade pump control with two electronic pressure transmitters. If a sensor develops a fault, the board automatically switches to the second sensor. Pressure switch control available on request.
 - Jockey pump management.
 - Cycle reversal function (can be disabled). Automatically switches pumps after every start/stop cycle.
 - Automatic, manual or disabled mode switches for each pump (inside the board).
 - Periodic system self-test with an electrovalve command which opens the hydraulic circuit, simulates a pressure drop and consequently activates the control devices (pressure switches and pressure transmitters). Pump diagnostics.

fig. 1

GS

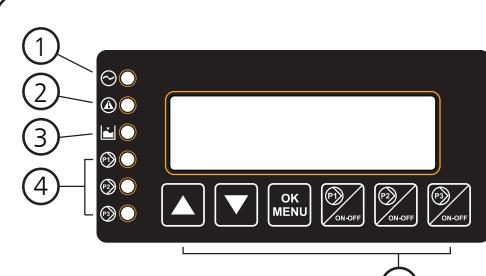

fig. 2

- No-water protection system alternatives: float, minimum pressure switch, external contact or electrode probes with sensitivity adjustment.
- Adjustable timer delaying tripping the no-water protection system.
- Adjustable timer delaying starting of each pump.
- Adjustable timer extending the operation of each pump.
- System pressure drop offset function, only available with pressure sensor. This function improves system stability.
- Adjustable analogue output, 4-20mA or 0-10Vdc, for visualising the analogue input signal.
- Configurable relay with volt-free contact, delayed activation, signalling the following conditions:
 - Motor overload protection alarm.
 - No-water circuit alarm.
 - Pressure sensor fault.
 - Out-of-curve operation alarms (only if self-test is disabled).
 - Maximum intake pressure alarm.
 - Electrovalve opening permission for self-test circuit.
- Configurable digital inputs.
 - AUX1 input configuration, maximum pressure switch or external self-test.
 - AUX2 input configuration, permission from external device (NO) or external alarm (NC).
 - AUX3 input configuration, change set (NO) or pressure switch operating out-of-curve.
- 12Vdc output for powering the acoustic alarm.

a xylem brand

CONTROL PANEL FOR GS20, GS21, GS30

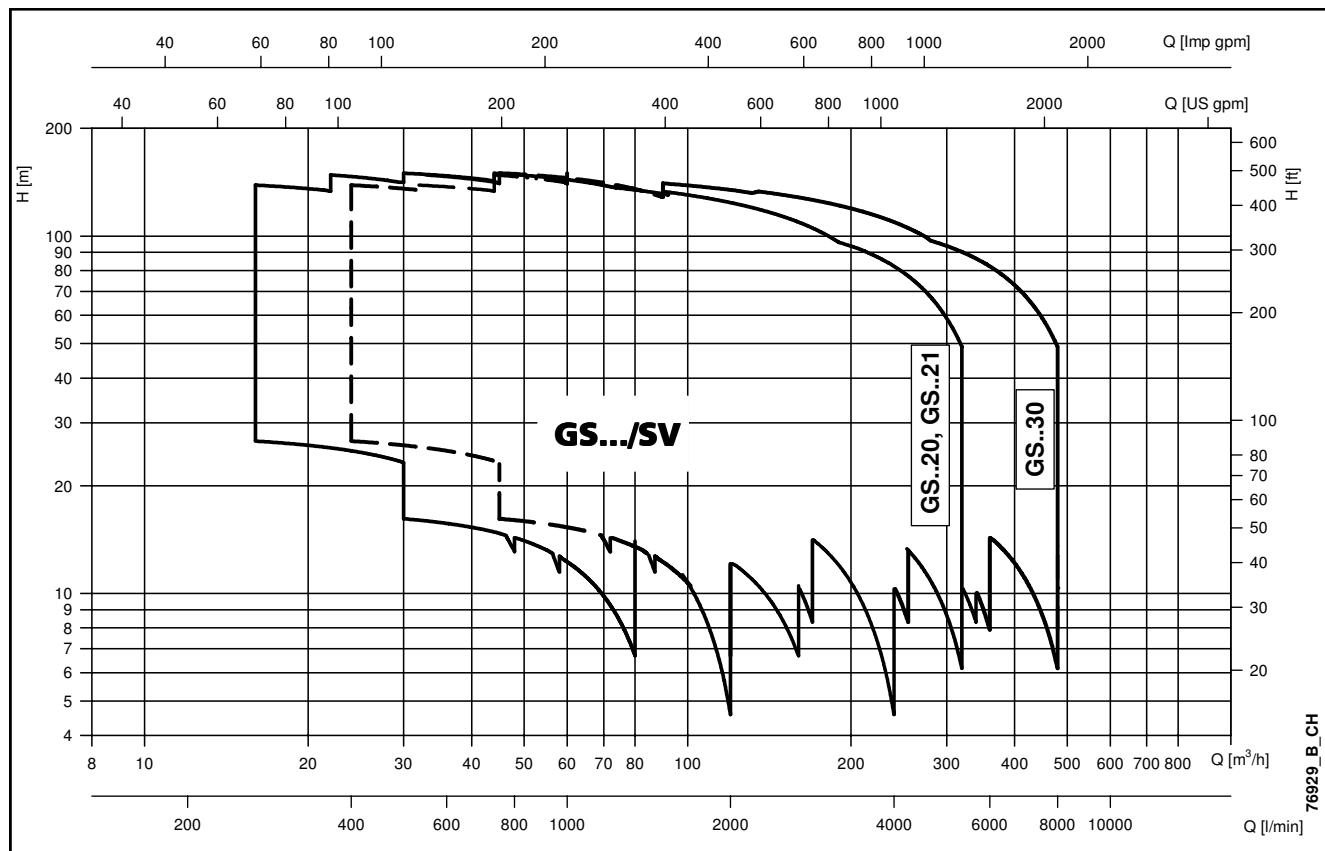

- Alarms log and hour counters for each installed pump. Alarms visualised on display:
 - Maximum, minimum pressure;
 - Circuit breaker for each motor;
 - Pressure transmitter fault.
 - Out-of-curve operation;
 - No water;
 - Block for tripped external device (PTC, temperature probe, etc.)
 - Auto-test failed
- All the alarms light the Fault lamp (ref.2 – fig.2)
- The no-water alarm lights the Level alarm lamp (ref.3 – fig.2)
- Standard, RS485 serial communication, slave, and ModBus RTU protocol.
- The GSM/GPRS module can be connected to send pump alarms and/or operating states via sms or e-mail. Connection via RS485 serial connection. SIM card not included.
- A relay board (optional) can be connected to boost the following signals: pump running, aut-man mode for each pump, overload alarm, no-water alarm, maximum/minimum pressure alarm, power on, self-test failed. The optional signal booster board has six relays, each of which can be configured using the Lowara SM30 control unit.

GS.../SV Series

Fixed-speed pressure booster sets
Vertical Multistage electric pumps e-SV™ series
equipped with high efficiency motors
flow rate up to 480 m³/h

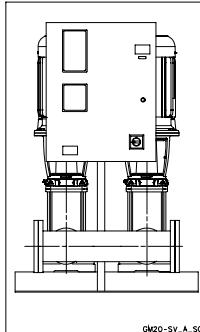

50 Hz

GS.../SV SERIES HYDRAULIC PERFORMANCE RANGE AT 50 Hz

RANGE

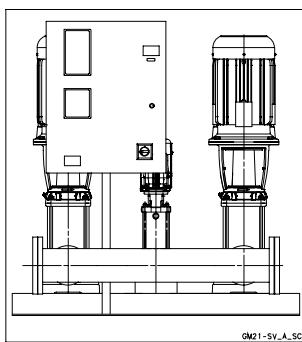

The GS series of fixed-speed pressure boosters comprises models with 2 or 3 electric service pumps and an optional jockey pump in order to satisfy the specific needs of every application.

GS.../SV

GS20 SETS

- Fixed-speed sets with two multistage vertical service pumps, SV series, with power ratings up to 37 kW.

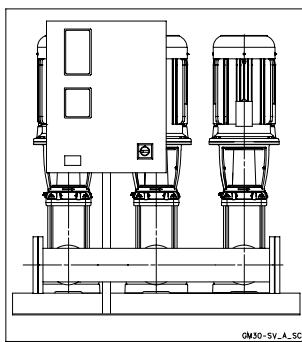

Head up to 160m.
Flow rate up to 320 m³/h.

GS21 SETS

- Fixed-speed sets with two service pumps and a jockey pump. Multistage vertical electric pumps, SV series, with power ratings up to 37 kW.

Head up to 160m.
Flow rate up to 320 m³/h.

GS30 SETS

- Fixed-speed sets with three multistage vertical service pumps, SV series, with power ratings up to 37 kW.

Head up to 160m.
Flow rate up to 480 m³/h.

REFERENCE STANDARDS

- The Lowara booster sets are CE-marked for conformity with the following directives:
 - Machinery Directive: 2006/42/EC.
 - Low Voltage Directive 2006/95/EC.
 - Electromagnetic Compatibility Directive 2004/108/EC
- Electric pump performance complies with the following standard:
ISO 9906-A Rotodynamic pumps – hydraulic performance acceptance tests.

CHARACTERISTICS OF THE ELECTRIC PUMPS

The SV pump is a multistage vertical pump, not self-priming, combined with a normalised standard motor. The hydraulic part is kept in place between the upper cover and the pump body with tie-rods. The pump body is available in different configurations and connection typologies.

Technical Information:

Flow rates: up to 160 m³/h.

Heads: up to 160 m.

Temperature of pumped liquid:

- from -30°C to +120°C for:
3, 5, 10, 15, 22, 33, 46, 66, 92, 125SV standard version.

Tested to ISO 9906 annex A.

Clockwise direction of rotation looking
at the pump from above (indicated
with an arrow on the bracket and joint).

Motor

Short circuit squirrel cage motor, totally enclosed, fan-cooled. Standard supplied IE2/IE3 motors are compliant with Regulation (EC) no. 640/2009 and IEC 60034-30.

IP55 protection.

Class 155 (F) insulation.

Performance levels according to EN 60034-1.

Standard voltage:

Single-phase version: 220-240 V, 50 Hz.

Three-phase version: 220-240/380-415 V, 50 Hz for power up to 3 kW,
380-415/660-690 V, 50 Hz for power above 3 kW.

For electrical data of the motors used see Technical Appendix.

Materials

Suitable for pumping drinking water (WRAS certified).

CHARACTERISTICS OF THE ELECTRIC PUMPS USED IN GS SERIES BOOSTER SETS

CHARACTERISTICS OF 3, 5, 10, 15, 22SV SERIES

- Vertical multistage centrifugal pump. All metal parts in contact with the pumped liquid are made of stainless steel.
- The following versions are available:
 - **F**: round flanges, in-line delivery and suction ports, AISI 304.
 - **T**: oval flanges, in-line delivery and suction ports, AISI 304.
 - **R**: round flanges, delivery port above the suction port, with four adjustable positions, AISI 304.
 - **N**: round flanges, in-line delivery and suction ports, AISI 316.
 - **V, P**: Victaulic® couplings, in-line delivery and suction ports, AISI 316.
 - **C**: Clamp couplings (DIN 32676), in-line delivery and suction ports, AISI 316.
 - **K**: threaded couplings, (DIN 11851), in-line delivery and suction ports, AISI 316.
- Reduced axial thrusts enable the use of **standard motors** that are easily found in the market.
Standard supplied IE2/IE3 three-phase surface motors ≥ 0,75 kW are compliant with Regulation (EC) no. 640/2009.
- Mechanical seal according to EN 12756 (ex DIN 24960) and ISO 3069 for 1, 3, 5SV and 10, 15, 22SV (\leq of 4 kW) series.
- **Balanced mechanical seal** according to EN 12756 (ex DIN 24960) and ISO 3069, which **can be replaced without removing the motor from the pump** for 10, 15 and 22SV (\geq of 5,5 kW) series.
- Seal housing chamber designed to prevent the accumulation of air in the critical area next to the mechanical seal.
- A second plug is available for 10, 15, 22SV series.
- Versions with round flanges that can be coupled to counter-flanges, according to EN 1092.
- Threaded, oval counter-flanges made of stainless steel are standard supply for the T versions.
- Round counter-flanges made of stainless steel are available on request for the F, R and N versions.
- Easy maintenance. No special tools required for assembly or disassembly.
- **The pumps for F, T, R, N versions are certified for drinking water use (WRAS and ACS certified).**
- Standard version for temperatures ranging from -30°C to +120°C.

GS.../SV

CHARACTERISTICS OF SV33, 46, 66, 92 SERIES

- The following versions are available:
 - **G**: vertical multistage centrifugal pump with impellers, diffusers and outer sleeve made entirely of stainless steel, and with pump casing and motor adaptor made of cast iron.
 - **N, P**: version made entirely of AISI 316 stainless steel.
- Innovative axial load compensation system on pumps with higher head. This ensures reduced axial thrusts and enables the use of **standard motors** that are easily found in the market. **Standard supplied IE2/IE3 three-phase surface motors are compliant with Regulation (EC) no. 640/2009.**
- **Balanced mechanical seal** according to EN 12756 (ex DIN 24960) and ISO 3069, which **can be replaced without removing the motor from the pump**.
- Seal housing chamber designed to prevent the accumulation of air in the critical area next to the mechanical seal.
- **The pumps for G, N versions are certified for drinking water use (WRAS and ACS certified).**
- Standard version for temperatures ranging from -30°C to +120°C.
- Pump body fitted with couplings for installing pressure gauges on both suction and delivery flanges.
- In-line ports with round flanges that can be coupled to counter-flanges, in compliance with EN 1092.
- Mechanical sturdiness and easy maintenance. No special tools required for assembly or disassembly.

OPERATING CHARACTERISTICS AND LIMITS

Liquids handled	Water containing no gas or corrosive and/or aggressive substances.
Fluid temperature	Above -10°C a + 80 °C
Ambient temperature	Above 0°C a + 40 °C
Maximum operating pressure	Max 8 bar, 10 bar, 16 bar in function of pump type
Minimum inlet pressure	According to NPSH curve and losses, with a minimum margin of 0.5 m
Maximum inlet pressure	The inlet pressure added to the pressure of the pump at zero flow must be lower than the maximum operating pressure of the set.
Installation	Indoors, protected from the weather. Away from heat sources. Max elevation 1000 m ASL. Max humidity 50% without condensation.
Hourly starts (single pump)	0,37 kW ≤ Pn ≤ 3 kW max 60 starts per hour. Direct motor start; 4 kW ≤ Pn ≤ kW max 40 starts per hour. Direct motor start; 11 kW ≤ Pn ≤ kW max 30 starts per hour. Direct motor start; 18,5 kW ≤ Pn ≤ 22 kW max 24 starts per hour. Direct motor start; 30 kW ≤ Pn ≤ 37 kW max 16 starts per hour. Start/delta start; Pn = 45 kW max 8 starts per hour. Start/delta start;
Sound emission	See table

* On request, PN above in function of the pump

gfix_2p-en_c_ti

SOUND EMISSION LEVELS

50 Hz 2900 rpm		LpA (dB ±2)**

* R=Reduced motor casing size with respect to shaft extension and related flange.

gfix_2p-en_c_tr

** Noise value of the electric motor only.

MAIN COMPONENTS

- **Main On-off valves** on suction and discharge side of each pump, ball type with threaded coupling up to 2" size included. Butterfly type for installation between the flanges are used for larger diameters.
- **Check valve** on discharge side of each pump, spring-loaded type, with threaded coupling up to 1"1/2 size, as well as the double-swing type to fit between the flanges.
For applications with air-cushion surge tanks, they are mounted on the suction side and the set is equipped with a connector for G 1/2" threaded flexible air feeder pipe (GS..RA series).
- **Suction manifold** made of galvanized or AISI 304 stainless steel depending on the version, with threaded or flanged ends depending on the type of pump (see drawings). Threaded coupling for water charging.
- **Delivery manifold** made of galvanized or AISI 304 stainless steel depending on the version, with threaded or flanged ends depending on the type of pump (see drawings). Fitted with two R1" threaded couplings with caps to allow connection diaphragm pressure vessels.
- **Pressure gauge and 2 control transmitters** located on the delivery side of the unit.
- **Various couplings** in nickel-plated brass, galvanised steel or stainless steel depending on the version.
- **Mounting base**, for pumpset and panel mounting brackets:
 - in painted steel for sets with electric pumps series 15-22-33-46-66-92-125SV;
- **Electric control panel**, IP55 protection class.

STANDARD VERSIONS AVAILABLE

See table of materials.

STANDARD VERSION

For general applications

Sets with 10SV pumps:

Nickel-plated brass valves, brass non-return valves.

Sets with 15-22SV pumps:

Nickel-plated brass valves, non-return valves with stainless steel flaps.

Sets with 33-46-66-92-125SV pumps:

Valves with polyamide butterfly, non-return valves with stainless steel flaps.

DW VERSION (GS.../DW)

For drinking water applications.

The main components in contact with the liquid are certified suitable for drinking water or are made of AISI 304 or higher grade of stainless steel.

Sets with 10SV pumps:

Nickel-plated brass valves, brass non-return valves.

Sets with 15-22SV pumps:

Nickel-plated brass valves, non-return valves with stainless steel flaps.

Sets with 33-46-66-92-125SV pumps:

Valves with epoxy butterfly, non-return valves with stainless steel flaps.

AISI304 Version (GS.../A304),

AISI 316 (GS.../A316)

For special applications

Manifolds, valves, non-return valves and main components with parts directly in contact with the pumped liquid are made of AISI 304 or AISI 316 stainless steel.

Accessories available on request:

- Devices **against dry running** in one of the following versions:
 - float switch, for positive suction head;
 - probe electrodes kit, for positive suction head;
 - minimum pressure switch, for positive suction head.
- **Surge tank** in the following versions:
 - Air-cushion surge tank with compressor and accessories for surge tank and compressor.
 - Diaphragm vessel as an alternative to the air-cushion tank.
- **Kit featuring diaphragm expansion vessel** with ball valve (one for each pump), in the following versions, depending on the maximum head of the pumps:
 - 24-litre 8 bar cylinder water vessel kit
 - 24-litre 10 bar cylinder water vessel kit
 - 24-litre 16 bar cylinder water vessel kit
 - 20-litre 25 bar cylinder water vessel kit
- **Alarm kit**;
- **Air feeder** for **RA** version;
- **Air compressor** for **RA** version.

SPECIAL VERSIONS AVAILABLE ON REQUEST

(Contact the Sales and technical Assistance Service)

- Units with non-standard input voltages, such as three-phase 3x230V, 3x440V.
- Units with single-phase input voltages 1x230V.
- Jockey pump other than the standard ones illustrated in the catalogue.
- Support base in AISI 304, AISI 316 stainless steel.
- Units with stainless steel expansion vessels.
- Units with special valves.
- Units with 4 electric pumps (GS31...GS40...).
- Units with 5 electric pumps (GS41... GS50...).

Booster sets

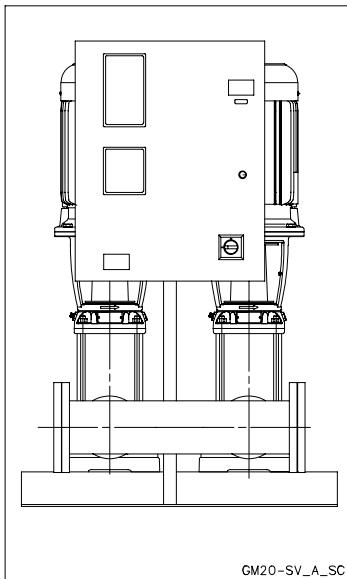

MARKET SECTORS

CIVIL, INDUSTRIAL

APPLICATIONS

- Water network supply in condominiums, offices, hotels, shopping centres, factories.
- Water supply to agricultural water networks (e.g. irrigation).

GSD20 - GSY20 Series

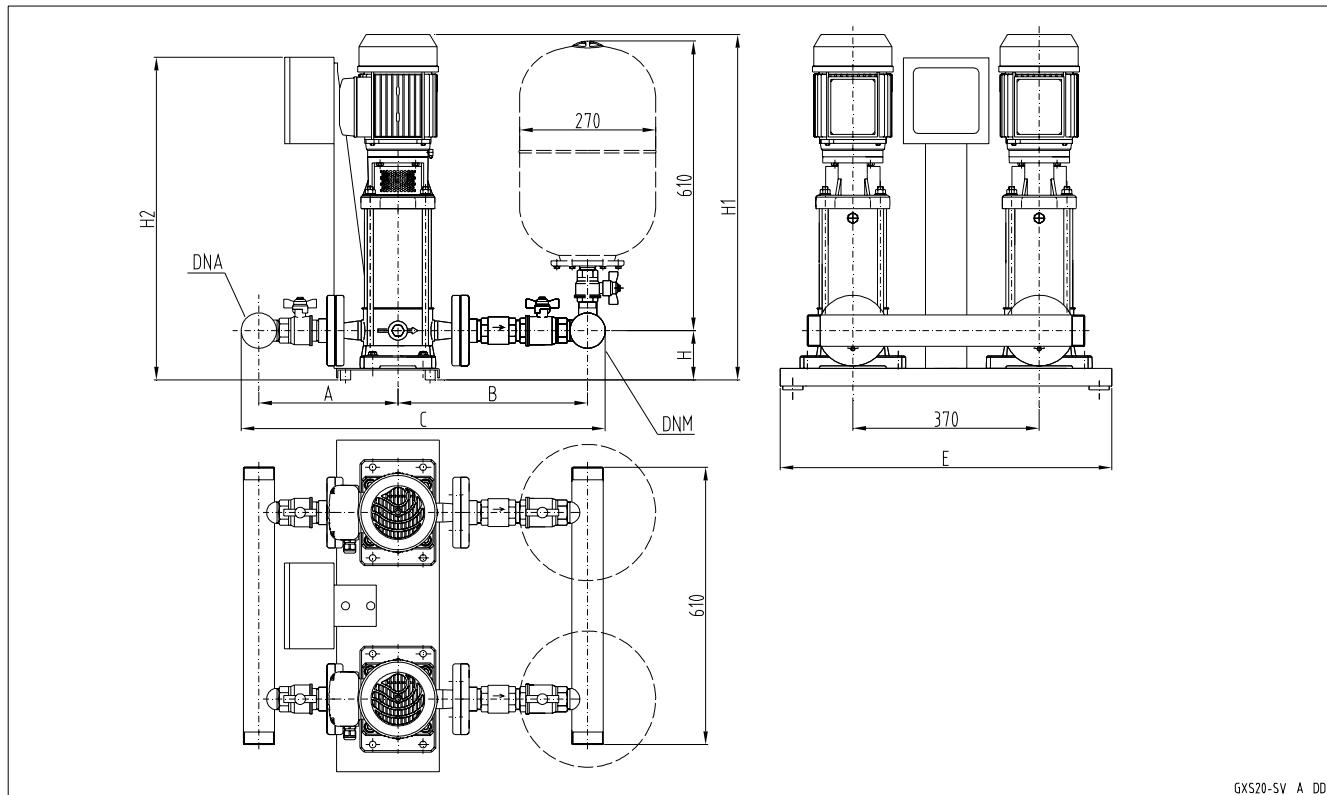

GSD20
GSY20

SPECIFICATIONS

- **Flow rate** up to 320 m³/h.
- **Head** up to 160 m.
- Electrical panel supply voltage: 3 x 400V ± 10%.
- Frequency 50 Hz.
- Voltage for controls outside panel: 24 Vac.
- Electrical panel protection class IP 55.
- Maximum service pump power: 2 x 37 kW.
- Motor start-up:
 - Direct for powers up to 22 kW inclusive for pump (GSD/).
 - Star/Delta for higher powers (GSY/ set).
 - Softstarter, available on request (GSSF/ set).
- **Electric pumps with vertical axis:**
 - SV series (motor protection class IP55).
 - Maximum operating pressure: 16 bar.
 - Maximum temperature of pumped liquid : +80°C.

Booster sets

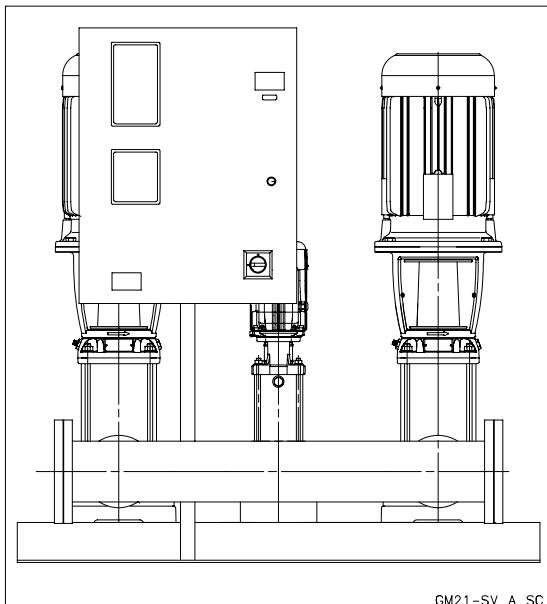

MARKET SECTORS

CIVIL, INDUSTRIAL

APPLICATIONS

- Water network supply in condominiums, offices, hotels, shopping centres, factories.
- Water supply to agricultural water networks (e.g. irrigation).

GSD21 - GSY21 Series

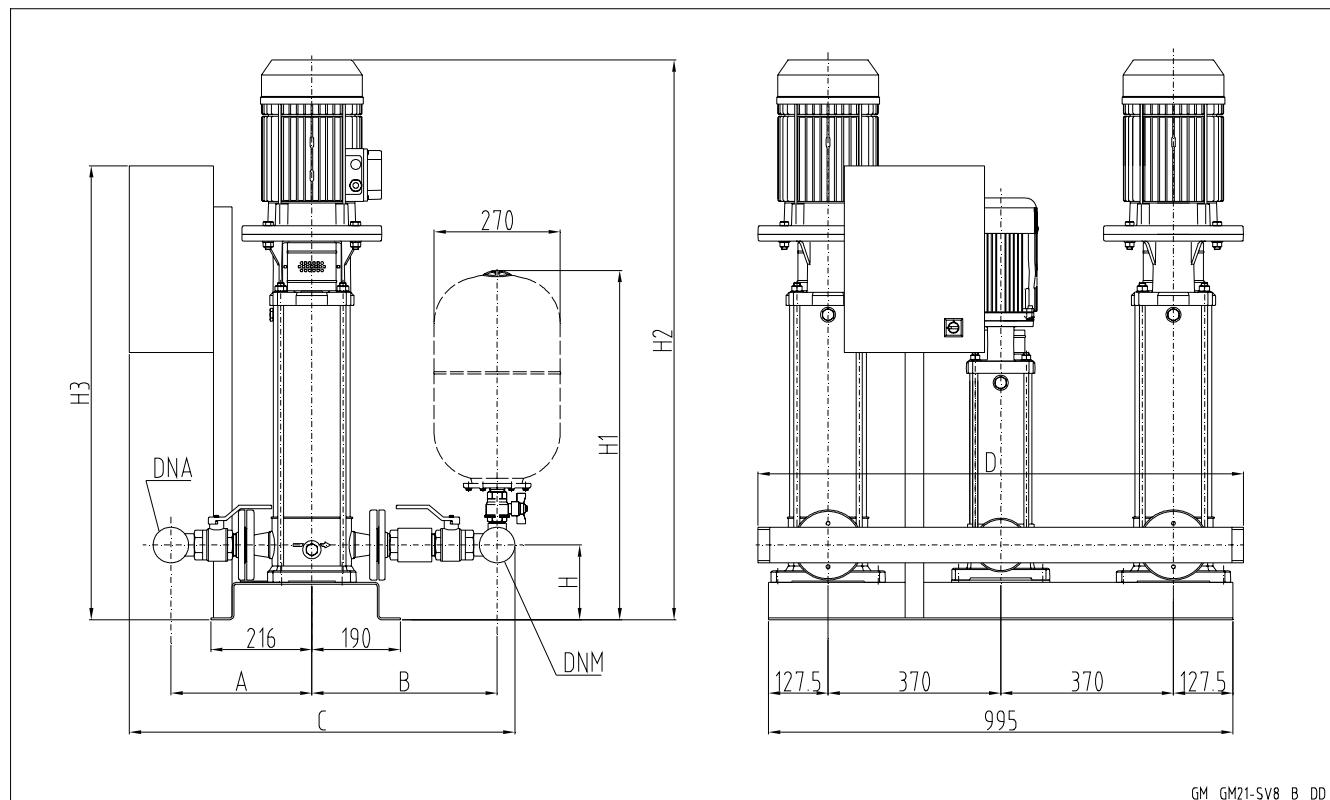

GSD21
GSY21

SPECIFICATIONS

- **Flow rate** up to 320 m³/h.
- **Head** up to 160 m.
- Electrical panel supply voltage: 3 x 400V ± 10%.
- Frequency 50 Hz.
- Voltage for controls outside panel: 24 Vac.
- Electrical panel protection class IP 55.
- Maximum service pump power: 2 x 37 kW.
- Motor start-up :
 - Direct for powers up to 22 kW inclusive for pump (GSD/).
 - Star/Delta for higher powers (GSY/ set).
 - Softstarter, available on request (GSSF/ set).
- **Electric pumps with vertical axis:**
 - SV series (motor protection class IP55).
- **Electric jockey pumps with vertical axis:**
 - SV series (motor protection class IP55).
- Maximum operating pressure: 16 bar.
- Maximum temperature of pumped liquid : +80°C.

Booster sets

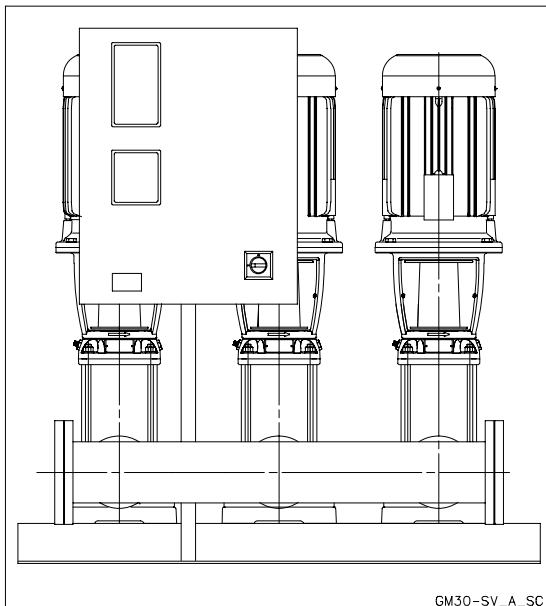

MARKET SECTORS

CIVIL, INDUSTRIAL

APPLICATIONS

- Water network supply in condominiums, offices, hotels, shopping centres, factories.
- Water supply to agricultural water networks (e.g. irrigation).

GSD30 - GSY30 Series

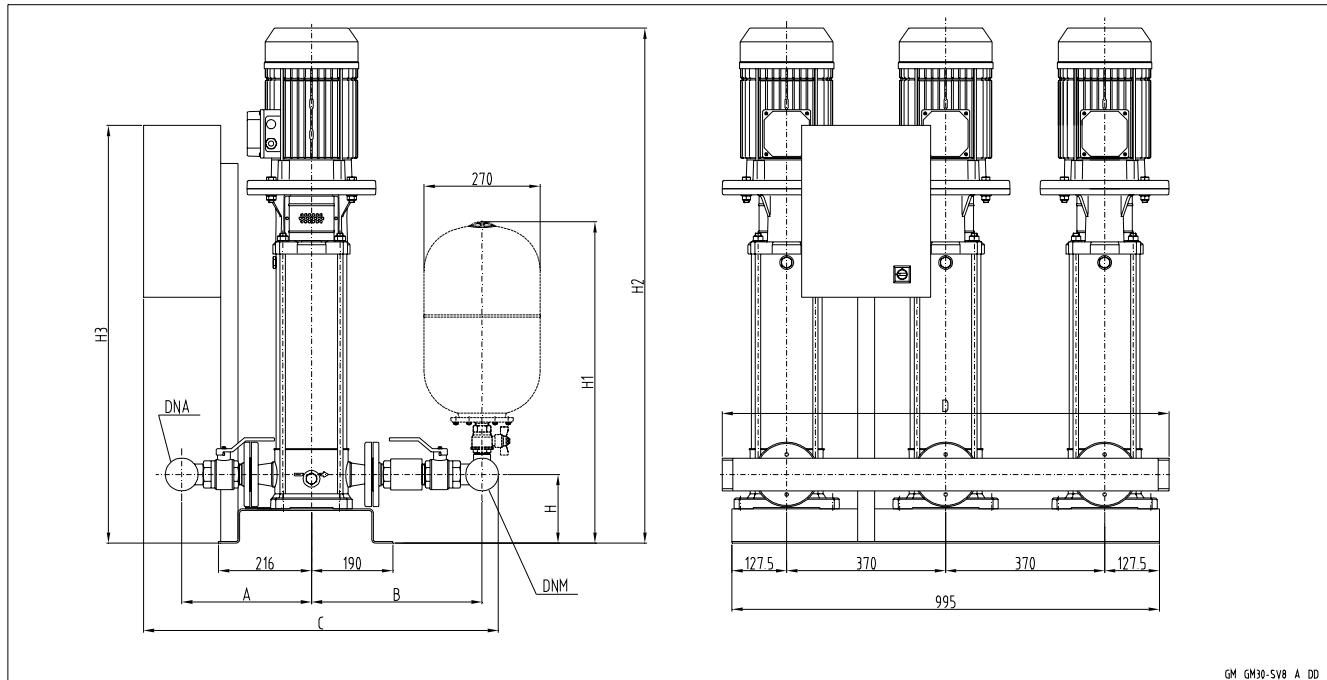

GSD30
GSY30

SPECIFICATIONS

- **Flow rate** up to 480 m³/h.
- **Head** up to 160 m.
- Electrical panel supply voltage : 3 x 400V ± 10%.
- Frequency 50 Hz.
- Voltage for controls outside panel: 24 Vac.
- Electrical panel protection class IP 55.
- Maximum service pump power: 3 x 37 kW.
- Motor start-up :
 - Direct for powers up to 22 kW inclusive for pump (GSD/).
 - Star/Delta for higher powers (GSY/ set).
 - Softstarter, available on request (GSSF/ set).
- **Electric pump with vertical axis:**
 - SV series (motor protection class IP55).
 - Maximum operating pressure 16 bar.
 - Maximum temperature of pumped liquid : +80°C.

**THREE-PUMP BOOSTER SETS, GSD30 SERIES
VERTICAL ELECTRIC PUMPS WITH NON-RETURN VALVE
ON DISCHARGE SIDE**

**BOOSTER SETS, GS.../SV SERIES
OPERATING CHARACTERISTICS AT 50 Hz (JOCKEY PUMP)**

The performance curves do not take into account flow resistance in the valves and piping.

The curves show performance with one pump running.

These performances are valid for liquids with density $\rho = 1.0 \text{ kg/dm}^3$ and kinematic viscosity $v = 1 \text{ mm}^2/\text{s}$.

**BOOSTER SETS, GS.../SV SERIES
OPERATING CHARACTERISTICS AT 50 Hz (SERVICE PUMP)**

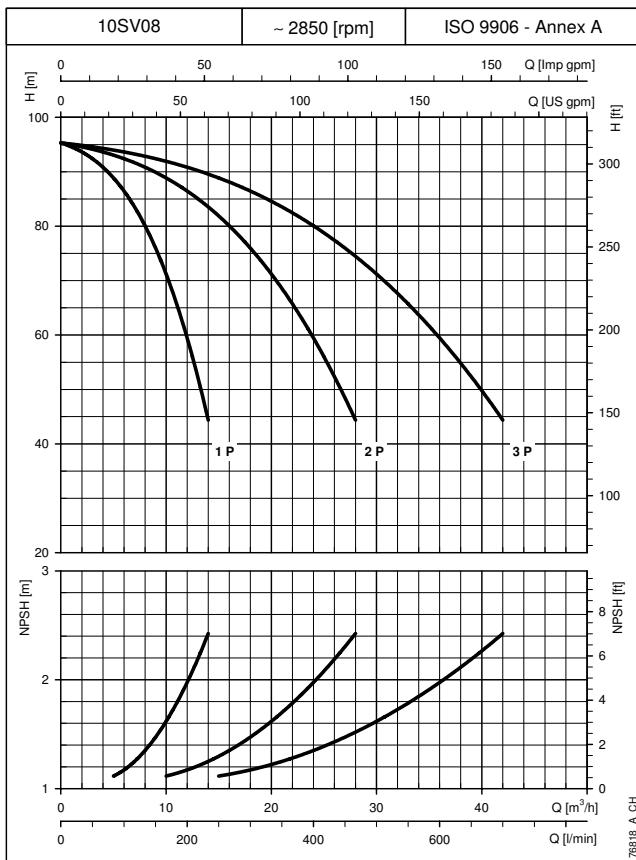

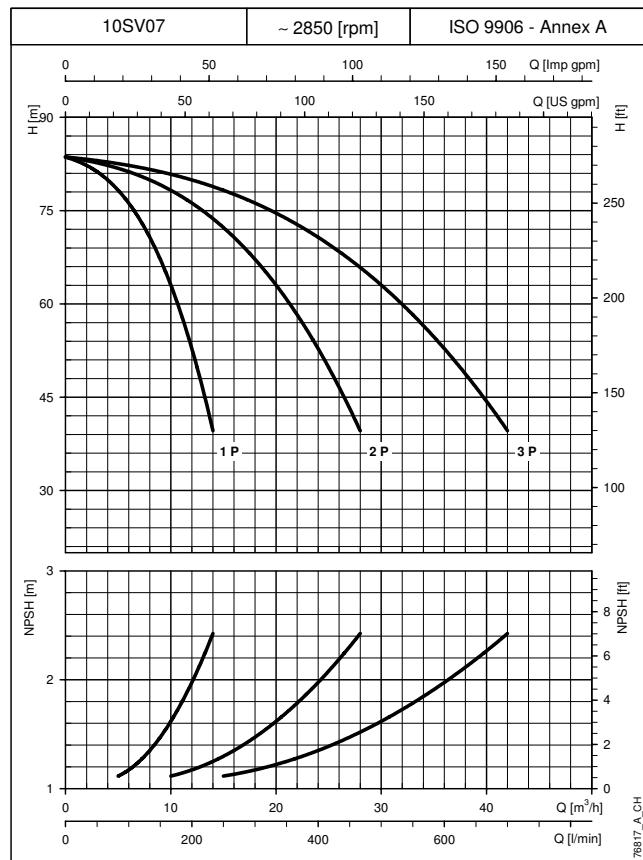

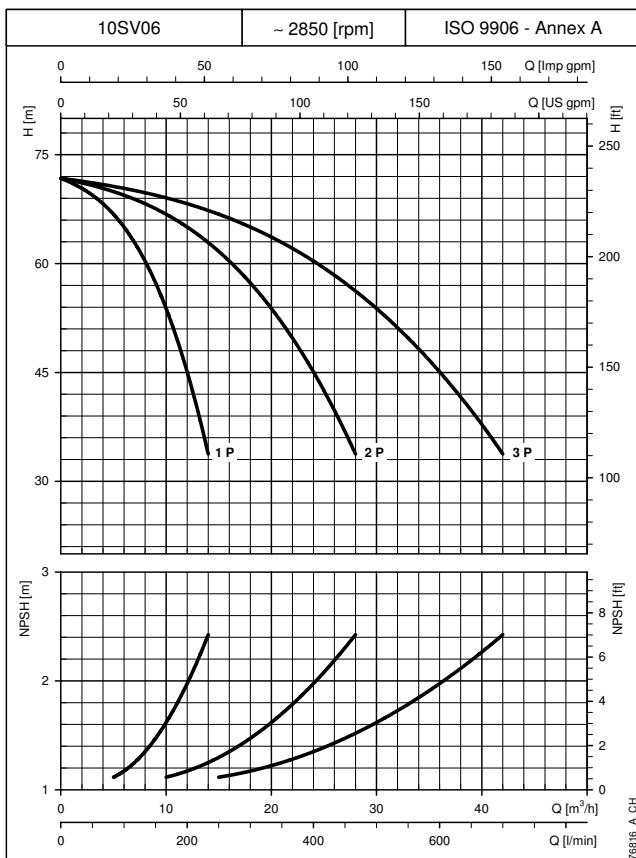

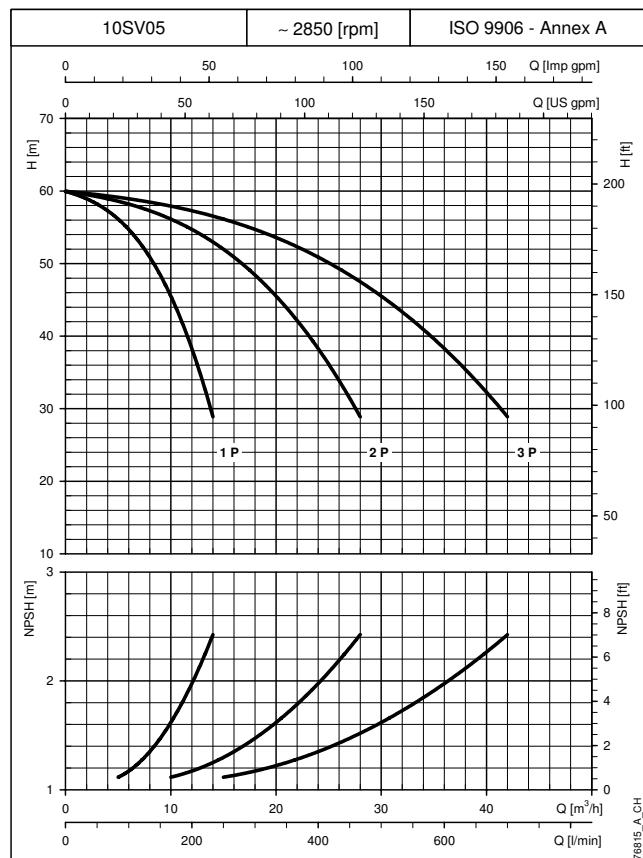

The performance curves do not take into account flow resistance in the valves and piping.

The curves show the performance with one, two and three pumps running.

These performances are valid for liquids with density $\rho = 1.0 \text{ Kg/dm}^3$ and kinematic viscosity $\nu = 1 \text{ mm}^2/\text{s}$.

The declared NPSH values are laboratory values: for practical use we recommend increasing these values by 0.5 m.

ACCESSORIES

ACCESSORIES

DIAPHRAGM TANKS

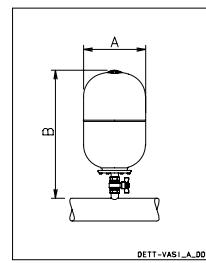

The booster sets are ready for installation, directly on the manifold, of 24-litre diaphragm tanks, one for each pump. The sets are also equipped with caps to close off the unused couplings. Larger tanks can also be connected to the unused end of the discharge manifold. For proper sizing of the tank please refer to the technical appendix.

Kits featuring the following accessories are **available on request**:

- diaphragm tank;
- on-off ball valve;
- operating instructions;
- packaging.

COUNTERFLANGE KIT

Manifolds up to 3" in diameter are usually supplied with threaded couplings and caps on unused end.

Counterflange coupling kits made of zinc-plated or stainless steel are available on request.

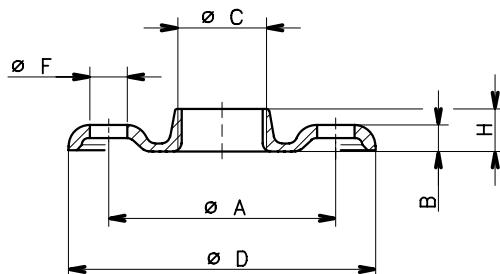

The counterflange kits are equipped with:

- threaded flange.
- gasket and bolts/screws.
- threaded counterflange (weld-on type for 3" diameter).

RUBBER EXPANSION JOINT KIT

The anti-vibrating joints or compensation joints can be used in order to absorb deformations, expansions, noises in the piping and to reduced ram blows. Moreover they can resist a high degree of empty that allows the absorption of negative expansions for depression.

Being of elastic material it can be become deformed and be dilated facilitating therefore the installation, that it becomes simpler and fast, also in which the piping they are not aligned. It does not need assembly joints.

DRY RUNNING PROTECTION SYSTEMS

Dry run shutdown systems should be installed to protect the pumps in case of insufficient water supply.

FLOAT SWITCH PROTECTION METHOD

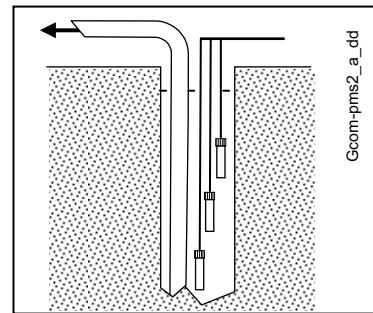

The float switch protection system is used when the water supply comes from open tanks. A float switch immersed in the tank is connected to the electrical panel.

If the water supply is insufficient, the float switch opens the electric contact and the pumps stop running.

ELECTRODE PROBE PROTECTION METHOD

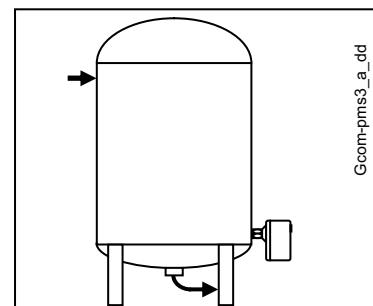

The electrode probe protection system is used when the water supply comes from open tanks or wells. A set of three probes is connected directly to the electronic board in the electrical panel. With the three electrodes immersed in the water, the relay on the electronic board closes the contact, enabling the starting of the pumps. If the water supply is insufficient, the control circuit opens the electric contact and the pumps stop running.

MINIMUM PRESSURE SWITCH PROTECTION METHOD

The minimum pressure switch protection system is used when the water supply comes from water networks or pressurized tanks. The pressure switch is connected to the electronic board in the electrical panel.

If the water supply is insufficient, the pressure switch opens the electric contact and the pumps stop running.

TECHNICAL APPENDIX

**TECHNICAL
APPENDIX**

WATER REQUIREMENTS IN CIVIL USERS

Determination of the water requirement depends on the type of users and contemporaneity factor. The calculation may be subject to regulations, standards or customs that may vary from country to country. The calculation method shown below is an example based on practical experience, designed to provide a reference value and not a substitute for detailed analytical calculation.

Water requirements in condominiums

The **consumption table** shows the maximum values for each delivery point, depending on the plumbing amenities.

MAXIMUM CONSUMPTION FOR EACH DELIVERY POINT

TYPE	CONSUMPTION (l/min)
Sink	9
Dishwasher	10
Washing machine	12
Shower	12
Bathtub	15
Washbasin	6
Bidet	6
Flush tank WC	6
Controlled flushing system WC	90

G-at-cm_a_th

The **sum of the water consumption values** of each delivery point determines the maximum theoretical requirement, which must be reduced according to the **contemporaneity coefficient**, because in actual fact the delivery points are never used all together.

$$f = \frac{1}{\sqrt{(0,857 \times Nr \times Na)}} \quad \text{Coefficient for apartments with one bathroom and flush tank WC}$$

$$f = \frac{1}{\sqrt{(0,857 \times Nr \times Na)}} \quad \text{Coefficient for apartments with one bathroom and controlled flushing system WC}$$

$$f = \frac{1,03}{\sqrt{(0,545 \times Nr \times Na)}} \quad \text{Coefficient for apartments with two bathrooms and flush tank WC}$$

$$f = \frac{0,8}{\sqrt{(0,727 \times Nr \times Na)}} \quad \text{Coefficient for apartments with two bathrooms and controlled flushing system WC}$$

f = coefficient; Nr = number of delivery points; Na = number of apartments

The **table of water requirements in civil users** shows the maximum contemporaneity flow-rate values based on the **number of apartments** and the type of WC for apartments with one bathroom and two bathrooms. As regards apartments with one bathroom, 7 drawing points have been taken into consideration, while 11 points have been considered for apartments with two bathrooms. If the number of drawing points or apartments is different, use the formulas to **calculate** the requirement.

For seaside resorts, a flow rate increased by at least 20% must be considered.

G-at-fi_a_th

WATER REQUIREMENTS FOR COMMUNITY BUILDINGS

The requirements of buildings intended for specific uses, such as **offices, residential units, hotels, department stores, nursing homes** and so on, are different from those of condominiums, and both their global daily water consumption and the maximum contemporaneity flow rate are usually greater. The **diagram of water requirements for community buildings** shows the maximum contemporaneity flow rate of some types of communities, for guidance.

These requirements must be determined case by case with the utmost accuracy, using analytical calculation methods, according to particular needs and local provisions.

For seaside resorts, the flow rate must be increased by at least 20%.

- 1 = Offices (N. of people)
- 2 = Department stores (N. of people)
- 3 = Nursing homes (N. of beds)
- 4 = Hotels, residences (N. of beds)

USE OF BOOSTER SET

Water is usually delivered by public supply systems and the pressure is generally sufficient for the proper operation of the users' water and sanitary equipment.

When this pressure is not sufficient, booster sets are employed to increase water pressure and ensure an acceptable minimum value at the furthest points. Therefore, the water supply to a building, group of buildings or to a system in general can be considered satisfactory when all the user points can deliver the required quantity of water.

Set connection methods (intake side)

Water can be supplied to a booster set in two ways:

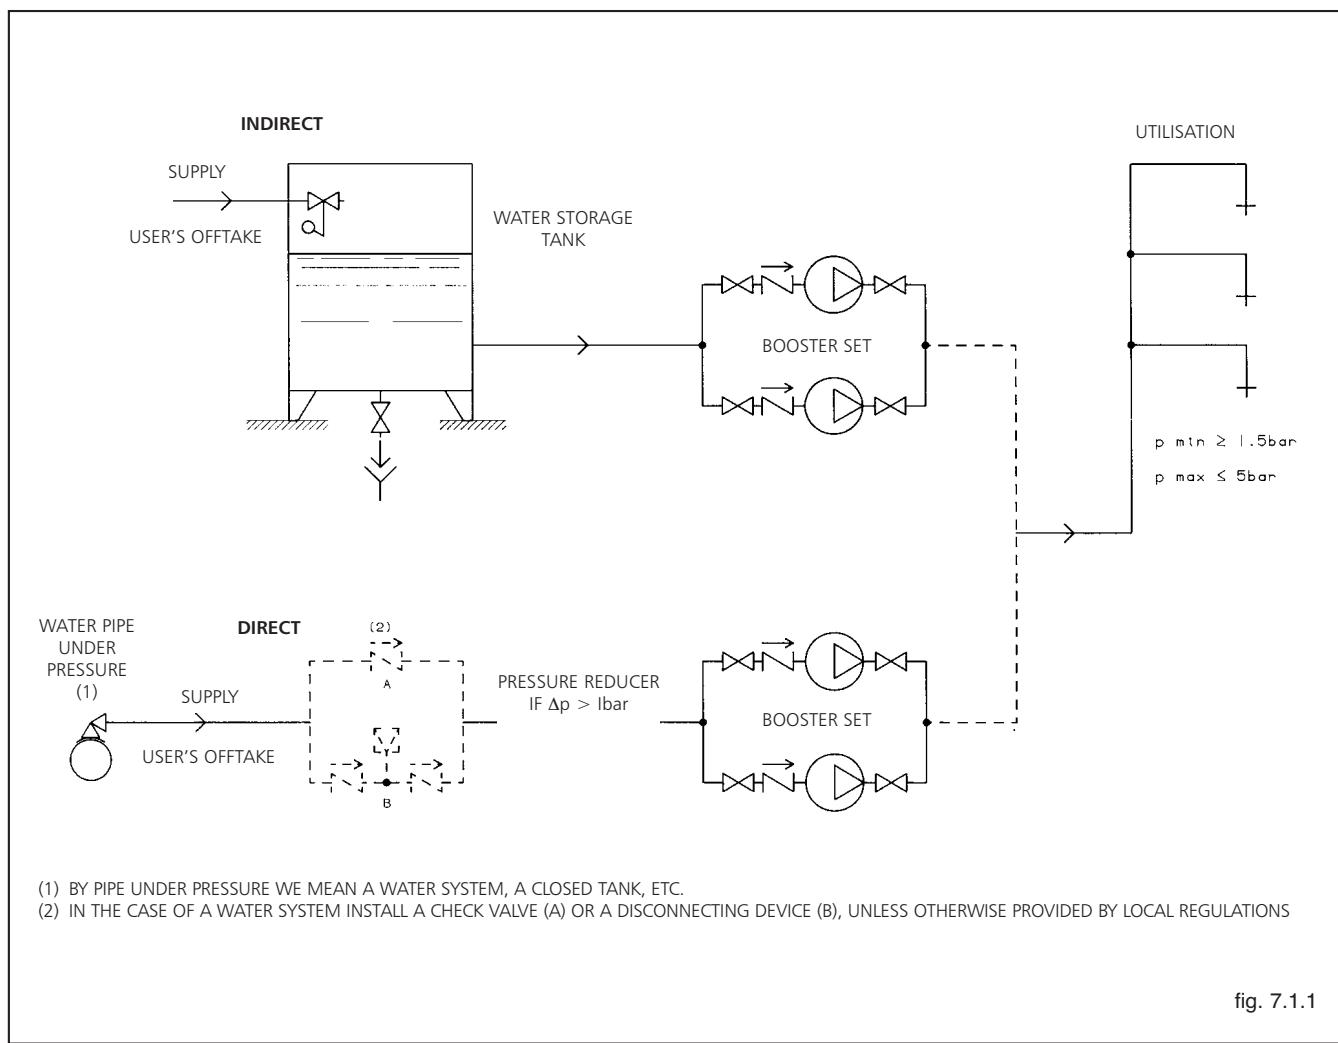

1 - By installing a water storage tank between the user's offtake and the booster set (indirect connection, fig. 7.1.1).

2 - By connecting the booster set directly between the user's offtake and the system (direct connection, fig. 7.1.1).

The indirect connection does not allow the water system pressure to be utilized. Therefore, it requires pumps with greater head.

The direct connection allows the water system pressure to be utilized, provided the pressure fluctuation (Δp) does not exceed 1 bar.

If it does, a pressure reducer must be installed for proper operation of the booster set.

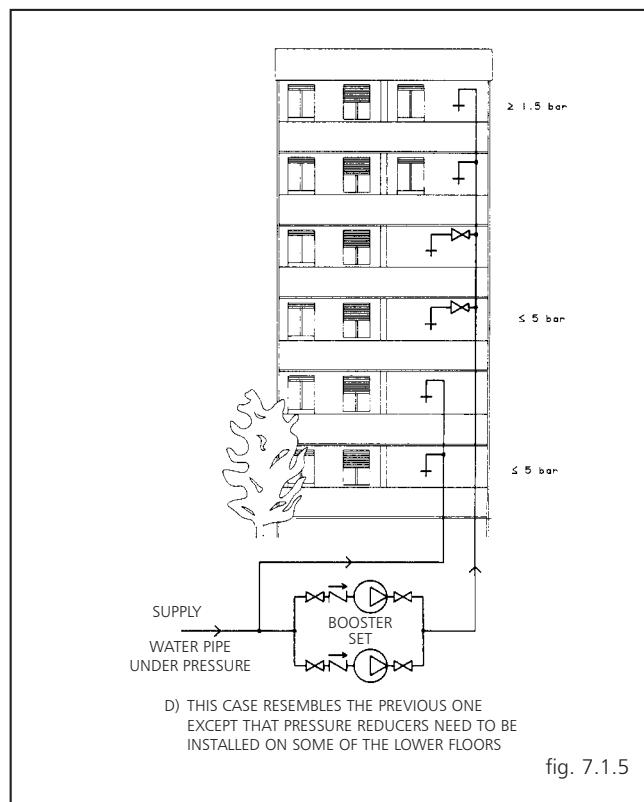

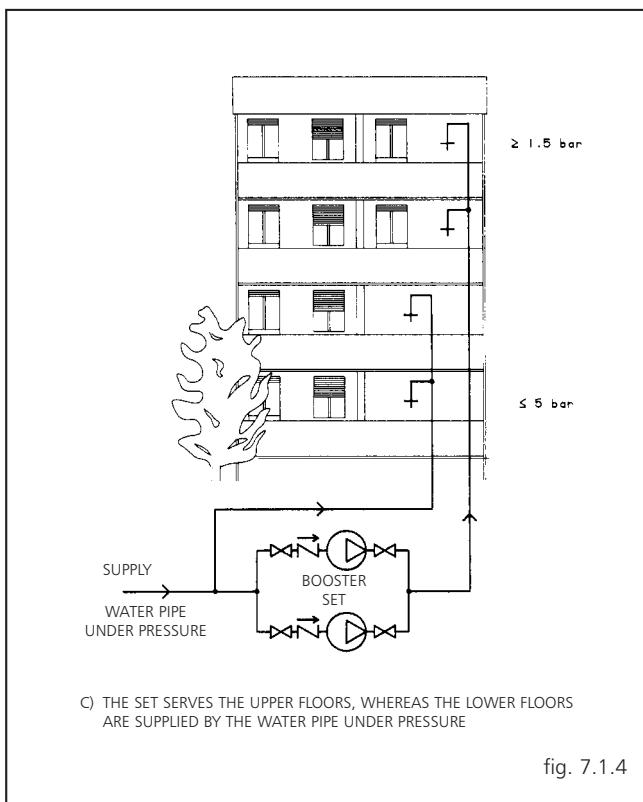

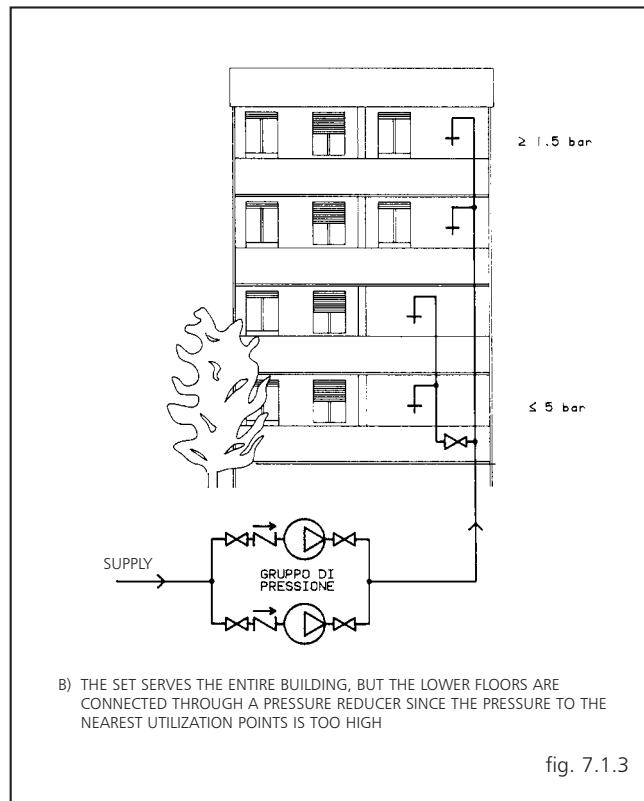

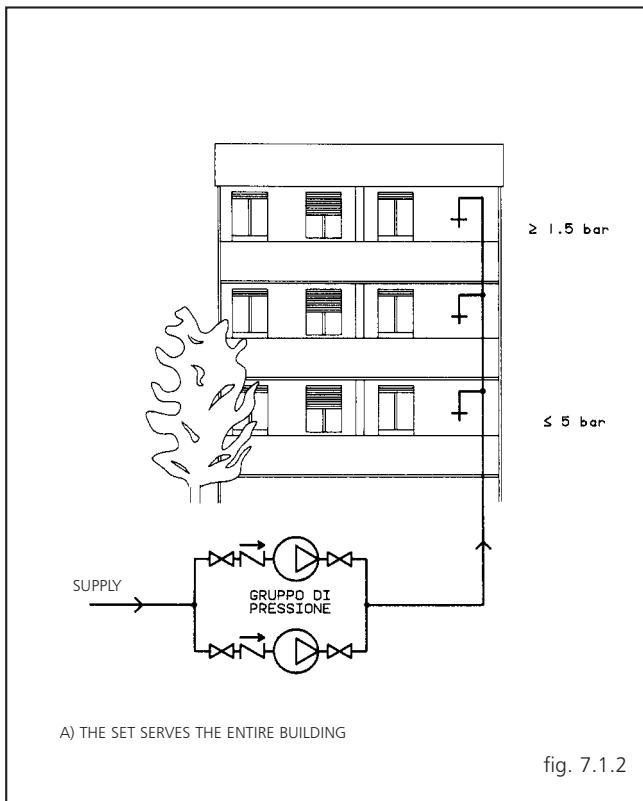

Water supply systems in civil buildings

The configuration of the supply system must comply with the following conditions:

- The minimum pressure ensuring the proper operation of the equipment must be guaranteed at the most unfavourable drawing point (1.5 bar for valves and flush tank WC, and 2 bar for controlled flushing system WC).
- At the most favourable drawing point, pressure must not exceed 5 bar.

Once these parameters have been satisfied, in relation to the height of the building and to the set intake conditions, the water supply system can have one of the following configurations:

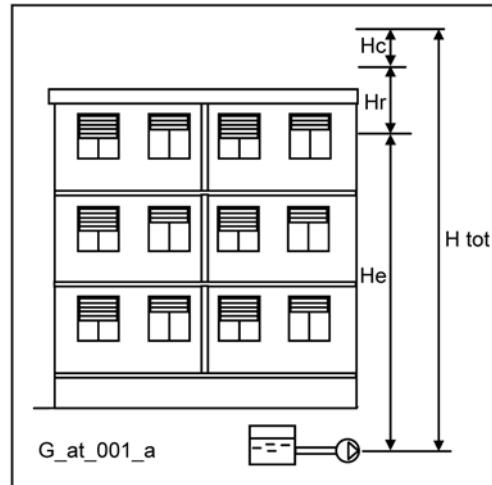

DETERMINING THE HEAD OF THE SET AND INTAKE CONDITIONS

Level intake

The delivery head of the set (H_{tot}) is the sum of:

- He : geodetic difference in level between the set and the furthest delivery point.
- Hc : flow resistance along all the pipes and through other system components, such as valves, filters, etc..
- Hr : pressure required at the most unfavourable point.

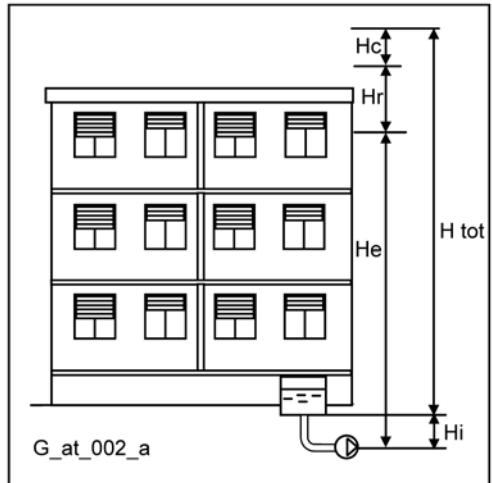

$$H_{tot} = He + Hc + Hr$$

Intake with positive head

In this case, the necessary delivery head (H_{tot}) will be reduced by the inlet pressure value (Hi).

$$H_{tot} = He + Hc + Hr - Hi$$

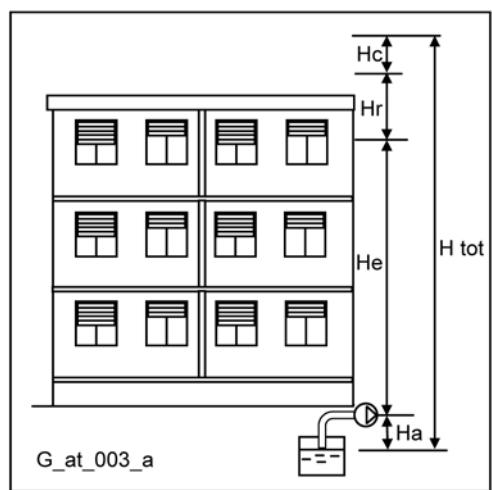

Intake with negative head

When the pumps suck from an underground tank or well, the necessary head will be increased by the value of the intake height (Ha):

$$H_{tot} = He + Hc + Hr + Ha$$

In this case the intake height must be considered very carefully, bearing in mind that an excessive difference in level between the water storage tank and the set, or the wrong sizing of the intake pipe, can have adverse effects on pump operation, such as cavitation and unpriming.

NPSH

The minimum operating values that can be reached at the pump suction end are limited by the onset of cavitation.

Cavitation is the formation of vapour-filled cavities within liquids where the pressure is locally reduced to a critical value, or where the local pressure is equal to, or just below the vapour pressure of the liquid.

The vapour-filled cavities flow with the current and when they reach a higher pressure area the vapour contained in the cavities condenses. The cavities collide, generating pressure waves that are transmitted to the walls. These, being subjected to stress cycles, gradually become deformed and yield due to fatigue. This phenomenon, characterized by a metallic noise produced by the hammering on the pipe walls, is called incipient cavitation.

The damage caused by cavitation may be magnified by electrochemical corrosion and a local rise in temperature due to the plastic deformation of the walls. The materials that offer the highest resistance to heat and corrosion are alloy steels, especially austenitic steel. The conditions that trigger cavitation may be assessed by calculating the total net suction head, referred to in technical literature with the acronym NPSH (Net Positive Suction Head).

The NPSH represents the total energy (expressed in m.) of the liquid measured at suction under conditions of incipient cavitation, excluding the vapour pressure (expressed in m.) that the liquid has at the pump inlet.

To find the static height h_z at which to install the machine under safe conditions, the following formula must be verified:

$$h_p + h_z \geq (NPSH_r + 0.5) + h_f + h_{pv} \quad ①$$

where:

h_p is the absolute pressure applied to the free liquid surface in the suction tank, expressed in m. of liquid; h_p is the quotient between the barometric pressure and the specific weight of the liquid.

h_z is the suction lift between the pump axis and the free liquid surface in the suction tank, expressed in m.; h_z is negative when the liquid level is lower than the pump axis.

h_f is the flow resistance in the suction line and its accessories, such as: fittings, foot valve, gate valve, elbows, etc.

h_{pv} is the vapour pressure of the liquid at the operating temperature, expressed in m. of liquid. h_{pv} is the quotient between the P_v vapour pressure and the liquid's specific weight.

0,5 is the safety factor.

The maximum possible suction head for installation depends on the value of the atmospheric pressure (i.e. the elevation above sea level at which the pump is installed) and the temperature of the liquid.

To help the user, with reference to water temperature (4° C) and to the elevation above sea level, the following tables show the drop in hydraulic pressure head in relation to the elevation above sea level, and the suction loss in relation to temperature.

Water temperature (°C)	20	40	60	80	90	110	120
Suction loss (m)	0,2	0,7	2,0	5,0	7,4	15,4	21,5
Elevation above sea level (m)	500	1000	1500	2000	2500	3000	

Suction loss (m)	0,55	1,1	1,65	2,2	2,75	3,3
---------------------	------	-----	------	-----	------	-----

Friction loss is shown in the tables at pages 117-118 of this catalogue. To reduce it to a minimum, especially in cases of high suction head (over 4-5 m.) or within the operating limits with high flow rates, we recommend using a suction line having a larger diameter than that of the pump's suction port. It is always a good idea to position the pump as close as possible to the liquid to be pumped.

Make the following calculation:

Liquid: water at ~15°C $\gamma = 1 \text{ kg/dm}^3$

Flow rate required: $30 \text{ m}^3/\text{h}$

Head for required delivery: 43 m.

Suction lift: 3,5 m.

The selection is an FHE 40-200/75 pump whose NPSH required value is, at $30 \text{ m}^3/\text{h}$, $d_i 2,5 \text{ m}$.

For water at 15 °C

$h_p = Pa / \gamma = 10,33 \text{ m}$, $h_{pv} = Pv / \gamma = 0,174 \text{ m}$ (0,01701 bar)

The Hf flow resistance in the suction line with foot valves is ~ 1,2 m.

By substituting the parameters in formula ① with the numeric values above, we have:

$$10,33 + (-3,5) \geq (2,5 + 0,5) + 1,2 + 0,17$$

from which we have: $6,8 > 4,4$

The relation is therefore verified.

CHOOSING AND SIZING THE SURGE TANK

The purpose of the surge tank is to limit the number of hourly starts of the pumps, placing part of its stock of water, which is maintained under pressure by the air above it, at the disposal of the system.

The surge tank can be of the air cushion or diaphragm type.

In the air cushion version there is no clear separation between air and water. Since part of the air tends to mix with water, it is necessary to restore it by means of air supply units or a compressor.

In the diaphragm version, neither air supply units nor compressor are needed, as contact between air and water is prevented by a flexible diaphragm inside the tank.

The following method, which is used to determine the volume of a surge tank, is valid both for horizontal and vertical surge tanks.

When calculating the volume of the surge tank, it is generally sufficient to consider the first pump only.

AIR-CUSHION SURGE TANK

It is determined in relation to flow rate, pump pressure, and number of starts per hour allowed by the motor.

$$V_a = \frac{1,25 \times Q_p \times (P_{max} + 10)}{4 \times Z \times (P_{max} - P_{min})}$$

where:

V_a = Total volume of the air-cushion surge tank in m^3
 Q_p = Average pump flow rate in m^3/h
 P_{max} = Maximum pressure setting (wcm)
 P_{min} = Minimum pressure setting (wcm)
 Z = Maximum number of starts per hour allowed by the motor

Warning! By pump flow rate we mean the average between the flow rate at the maximum pressure switch setting (Q_{max}) and the flow rate at the minimum pressure switch setting (Q_{min}), i.e.:

$$Q_p = \frac{Q_{max} + Q_{min}}{2} \quad (\text{m}^3/\text{h})$$

Example:

CN 32 - 160/22 pump
 $P_{max} = 32 \text{ mca}$
 $P_{min} = 22 \text{ mca}$
 $Q_p = 18 \text{ m}^3/\text{h}$
 $Z = 30$

$$V_a = \frac{1,25 \times 18 \times (32 + 10)}{4 \times 30 \times (32 - 22)} = 0,788 \text{ m}^3$$

A 750-litre surge tank is therefore required.

DIAPHRAGM TANK

If you decide to use a diaphragm tank, the volume will be lower than that of the air-cushion tank. It can be calculated with the following formula:

$$V_m = \frac{Q_p}{4 \times Z} \times \frac{1}{1 - \frac{(P_{min} - 2)}{P_{max}}}$$

where:

V_m = Total volume of the air-cushion surge tank in m^3
 Q_p = Average pump flow rate in m^3/h
 P_{max} = Maximum pressure setting (wcm)
 P_{min} = Minimum pressure setting (wcm)
 Z = Maximum number of starts per hour allowed by the motor

Example:

CN 32 - 160/22 pump

$P_{max} = 32 \text{ mca}$
 $P_{min} = 22 \text{ mca}$
 $Q_p = 18 \text{ m}^3/\text{h}$
 $Z = 30$

$$V_m = \frac{Q_p}{4 \times Z} \times \frac{1}{1 - \frac{(P_{min} - 2)}{P_{max}}} = 0,4 \text{ m}^3$$

A 500-litre surge tank is therefore required.

Approximate comparison between Lowara air-cushion tanks and diaphragm tanks, as regards some pressure switch setting values

G-at-pct_a_th

hr = flow resistance for 100m of straight pipeline (m)

V = water speed (m/s)

FLOW RESISTANCE

TABLE OF FLOW RESISTANCE IN BENDS, VALVES AND GATES

The flow resistance is calculated using the equivalent pipeline length method according to the table below:

ACCESSORY TYPE	DN											
	25	32	40	50	65	80	100	125	150	200	250	
	Equivalent pipeline length (m)											
45° bend	0,2	0,2	0,4	0,4	0,6	0,6	0,9	1,1	1,5	1,9	2,4	2,8
90° bend	0,4	0,6	0,9	1,1	1,3	1,5	2,1	2,6	3,0	3,9	4,7	5,8
90° smooth bend	0,4	0,4	0,4	0,6	0,9	1,1	1,3	1,7	1,9	2,8	3,4	3,9
Union tee or cross	1,1	1,3	1,7	2,1	2,6	3,2	4,3	5,3	6,4	7,5	10,7	12,8
Gate	-	-	-	0,2	0,2	0,2	0,4	0,4	0,6	0,9	1,1	1,3
Non return valve	1,1	1,5	1,9	2,4	3,0	3,4	4,7	5,9	7,4	9,6	11,8	13,9

G-a-pcv_a_th

The table is valid for the Hazen Williams coefficient C = 100 (cast iron pipework). For steel pipework, multiply the values by 1.41. For stainless steel, copper and coated cast iron pipework, multiply the values by 1.85.

When the **equivalent pipeline length** has been determined, the flow resistance is obtained from the table of flow resistance.

The values given are guideline values which are bound to vary slightly according to the model, especially for gate valves and non-return valves, for which it is a good idea to check the values supplied by the manufacturers.

Air supply unit

The most commonly used air supply unit model is the "depression" type, which uses the depression produced by the pump suction.

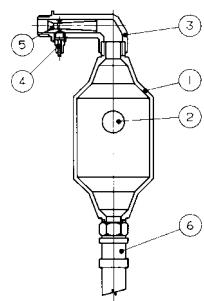

fig. 7.2.2 - The air supply unit consists of a body made of plastic material suitable for foodstuffs (1), a spherical rubber shutter (2), an upper brass union (3) with an air valve (4), a Venturi tube (5), and a flexible pipe (6) to be connected to the pump intake.

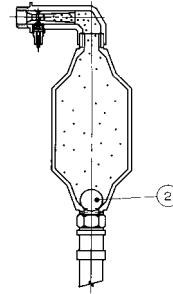

fig. 7.2.5 - The air accumulated inside the body pushes the rubber ball (2) to the bottom, thus blocking the passage. At this point the valve closes and the rubber ball prevents the air accumulated inside the body of the air supply unit from reaching the pump intake.

Air supply unit operation

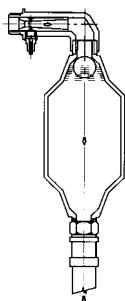

fig. 7.2.3 - When the pump starts up, the intake pressure is lower than the pressure in the surge tank. This difference causes water to flow from the surge tank to the pump intake, through the air supply unit.

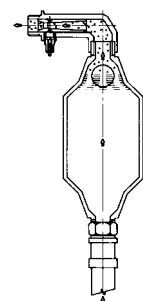

fig. 7.2.6 - When the pump stops the depression ceases and a flow of water is produced, which lifts the ball and pushes the air in the body of the supply unit into the tank.

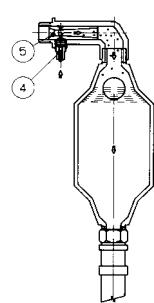

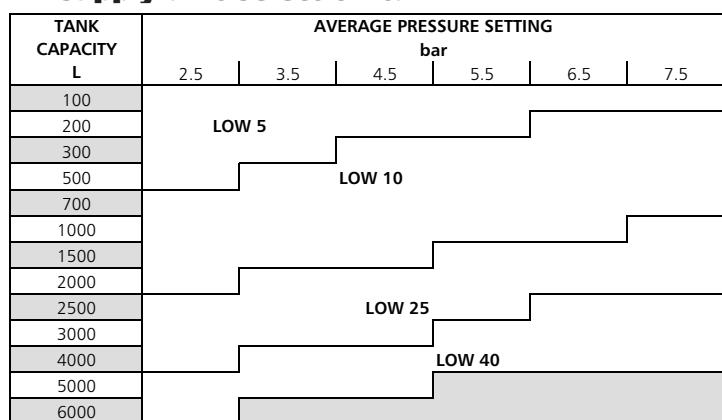

fig. 7.2.4 - The flow of water that passes through the Venturi tube (5) generates a depression and allows the opening of the air valve (4). As a consequence, air enters the body of the supply unit.

Air supply unit selection tank

This cycle is repeated each time the pump starts up until the required quantity of air has accumulated. To ensure proper system operation, no check valve must be mounted between the pump delivery outlet and the surge tank, as it would impede the return flow of water through the pump.

ASSESSMENT OF PROBABLE DEMAND (VALID IN U.K. ONLY)

The method adopted is based on loading unit values as detailed in the Plumbing Engineering Design Guide published by the Institute of Plumbing.

When designing a hot or cold water supply system an assessment must be made to obtain the maximum probable simultaneous demand.

Depending on the type of services being provided it rarely occurs for all the appliances to be used at the same time therefore the design usually allows for a peak usage which is less than the maximum.

Probable demand will depend on the type of building and its use, type of appliances installed and frequency of use.

The simultaneous demand in most installations can be calculated with an adequate degree of accuracy using the loading unit concept.

The usage patterns and types of appliances in different installations will vary greatly.

Sports and Leisure centres for example are usually calculated directly by the flow rates of each appliance, without diversity factors. Each case will need to be looked at in its own right and assessed accordingly. Judgement of the designer must prevail.

Loading unit values vary for each type of appliance. A loading unit has no precise value in terms of litres per second.

See loading unit table below.

By multiplying the total number of each appliance by the appropriate loading unit number and adding the resultant totals together, the recommended flow can be read from the chart.

Loading unit table

APPLIANCE	Loading Unit	Recommended Flow L/s
WC	1,5	0,12
Wash basin (hot & cold)	3	0,3
Sink (hot & cold)	6	0,4
Bath (hot & cold)	20	0,6
Shower (hot & cold)	10	0,24
Washing machine	2	0,3

g_at_a_LU

Working Example

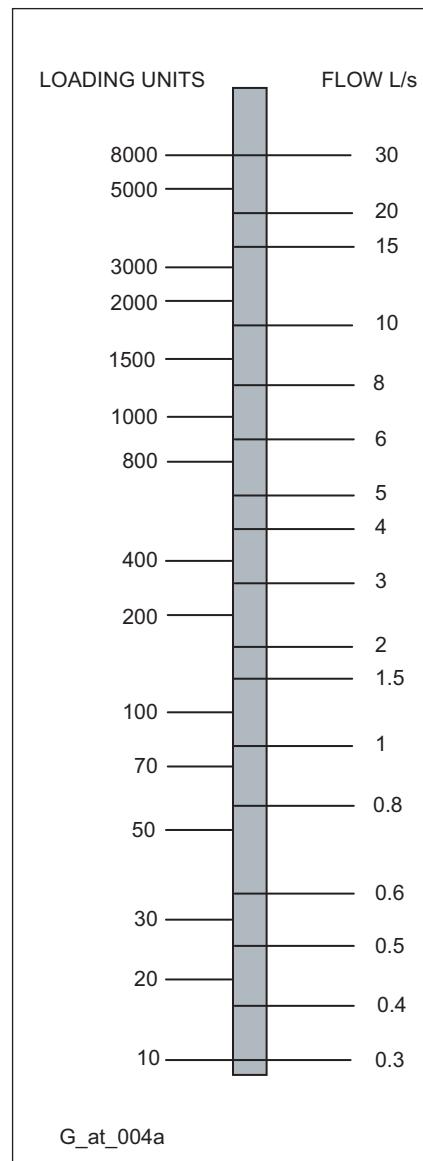

A block of standard flats containing a total of 70 dwellings

Each standard flat is assumed to have:

$$\begin{aligned}
 1 \times \text{Hand basin hot \& cold} &= 3 \text{ L/U} \times 70 = 210 \\
 1 \times \text{WC cold only} &= 1.5 \text{ L/U} \times 70 = 105 \\
 1 \times \text{Shower hot \& cold} &= 10 \text{ L/U} \times 70 = 700 \\
 1 \times \text{Sink hot \& cold} &= 6 \text{ L/U} \times 70 = 420
 \end{aligned}$$

Total Loading Unit = 1435

This figure can now be read from the chart opposite: total flow = 8.5 L/s

G_at_004a

ASSESSING HEAD REQUIREMENT (VALID IN U.K. ONLY)

The **head** required in a boosted cold water system consists of three components, static head, residual pressure and system friction losses. The values of these three components are added together to give the total required head at the system flow rate.

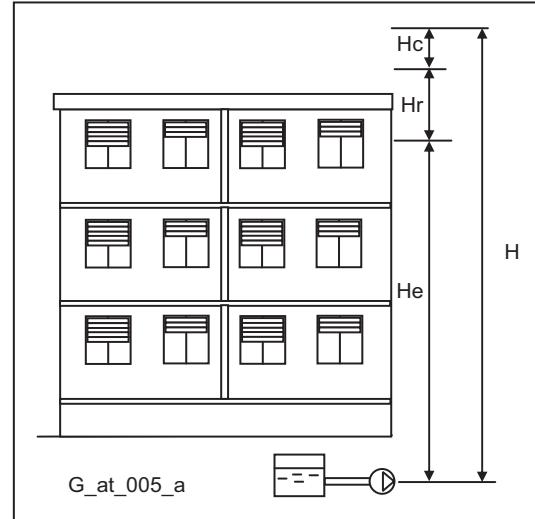

Static head (He): This is the difference between the break tank low water line and the highest discharge point in the building. If the height of the build is not known, then 2.8-3.0 metres per floor can be used to assess the building height.

Residual pressure (Hr): This is the pressure required at the highest outlet device, normally 20metres.

Note: some modern showers may require higher pressures.

System friction losses (Hc): The total losses through pipework, pipework fittings, valves, PRVs and all other equipment fed through the pumpset must be added to find the total system losses.

On conventional systems that do not include excessive runs of pipe or specialised components a rough guide would be to allow 0.05 metres friction loss for each metre of static head.

Example:

Static head (He): Building height four floors @ 2.8m each = 11.2m +

Residual pressure (Hr): Pressure at highest outlet = 20m +

Friction loses (Hc): 11.2 (static head) x 0.05 = 0.56m

Total pump head required (H) = 31.76m (3.11 Bar)

Pressure limitations

The designer must ensure that adequate precautions are taken to ensure that the system is capable of withstanding the closed valve head produced by the pump set. In cases where closed valve pressures cannot be tolerated, pressure reducing valves should be fitted down stream of the booster set.

Velocity

Pipework within the system should be sized to limit the velocity to the figures stated in table below.

Higher velocities will lead to excessive noise, wear and higher running costs.

PIPE SIZE	SUCTION PIPE	DELIVERY PIPE
	m/s	m/s
Less than 80mm	0,46	0,91 to 1,07
100-150mm	0,55	1,22 to 1,52
200mm	0,76	1,68
250 and above	0,91	1,82 to 2,13

g_at_a_fs

BOOSTER SIZING

What information do we require to size a booster set?

- As a minimum we need to know:
 - The total flow rate, or information to assess this.
 - The total head at flow rate, or the height of building.
 - If the pumps are to operate under positive head, or suction lift conditions.
 - Where the set is to be sited, I.E. basement or roof.
 - Preferred choice fixed or variable speed

- Additional information if available:
 - How to split the duty for particular applications I.E. duty/standby or duty/assist.
 - The size and material of the connecting pipework.
 - Is a Jockey pump required.

FURTHER PRODUCT SELECTION AND DOCUMENTATION**Xylect**

Xylect is pump solution selection software with an extensive online database of product information across the entire Lowara, and Vogel range of pumps and related products, with multiple search options and helpful project management facilities. The system holds up-to-date product information on thousands of products and accessories.

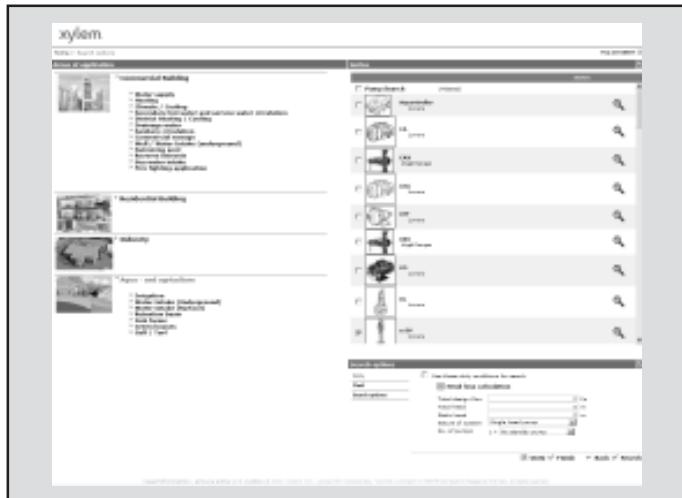

The possibility to search by applications and the detailed information output given makes it easy to make the optimal selection without having detailed knowledge about the Lowara and Vogel products.

The search can be made by:

- Application
- Product type
- Duty point

Xylect gives a detailed output:

- List with search results
- Performance curves (flow, head, power, efficiency, NPSH)
- Motor data
- Dimensional drawings
- Options
- Data sheet printouts
- Document downloads incl dxf files

The search by application guides users not familiar with the product range to the right choice.

FURTHER PRODUCT SELECTION AND DOCUMENTATION

Xylect

The screenshot shows the Xylect product configuration interface for Commercial Building pumps. At the top, there's a table listing various pump models with their item numbers, stages, discharge size, and other technical parameters. Below this is a performance curve graph for the selected model, showing Head [m], Efficiency [%], NPSH-values [m], and Shaft power P2 [kW] versus flow rate [m³/h]. To the right of the graph is a detailed configuration sidebar where users can specify parameters like stages, reference speed, motor type, and seal details. The sidebar also includes sections for 'Current configuration' and 'Configuration results'.

The detailed output makes it easy to select the optimal pump from the given alternatives.

The best way to work with Xylect is to create a personal account. This makes it possible to:

- Set own standard units
- Create and save projects
- Share projects with other Xylect users

Every user have a My Xylect space, where all projects are saved.

For more information about Xylect please contact our sales network or visit www.xylect.com.

This screenshot shows the Xylect interface displaying dimensional drawings for a specific pump model. On the left, there's a 2D cross-sectional diagram of the pump with various dimensions labeled. On the right, there are three 3D perspective views of the pump body, each with callouts pointing to specific parts and dimensions. A configuration sidebar on the right side allows users to specify dimensions like stage height, impeller diameter, and shaft length, along with material and seal options.

Dimensional drawings appear on the screen and can be downloaded in dxf format.

Note: Observe the regulations and codes locally in force regarding sorted waste disposal.

Xylem |'ziləm|

- 1) The tissue in plants that brings water upward from the roots;
- 2) a leading global water technology company.

We're 12,000 people unified in a common purpose: creating innovative solutions to meet our world's water needs. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. We move, treat, analyze, and return water to the environment, and we help people use water efficiently, in their homes, buildings, factories and farms. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise, backed by a legacy of innovation.
